

Project Notes:

Project Title: Examining Enhanced *Komagataeibacter hansenii* Production via Unconventional Food Waste

Name: Anika Karre

Note Well: There are NO SHORT-cuts to reading journal articles and taking notes from them. Comprehension is paramount. You will most likely need to read it several times, so set aside enough time in your schedule.

Article #1 Notes: Selecting the most appropriate treatment for each patient

Article notes should be on separate sheets

Source Title	Selecting the most appropriate treatment for each patient
Source citation (APA Format)	Beutler, L. E., Someah, K., Kimpara, S., & Miller, K. (2016). Selecting the most appropriate treatment for each patient. <i>International journal of clinical and health psychology : IJCHP</i> , 16(1), 99–108. https://doi.org/10.1016/j.ijchp.2015.08.001
Original URL	Selecting the most appropriate treatment for each patient - PMC (nih.gov)
Source type	Scientific journal “Articles from International Journal of Clinical and Health Psychology”
Keywords	Psychotherapy, Treatment outcomes, Integration efficacy, Treatment fit, Theoretical study
#Tags	#STS, #specificcharacteristics, #treatment, #psychotherapeuticstrategies
Summary of key points + notes (include methodology)	This article discusses potential treatment options and how they vary based on different factors including unique needs and specific diagnoses. The STS (Systematic Treatment Selection) in particular is a form of treatment that relies heavily on patient’s specific characteristics and interventions that match with those traits. Overall, this article covers various time periods and their main approaches as well as touching upon the methodology of STS and possible ways and ideas to test it.
Research Question/Problem/Need	Forms of therapy and how to choose the best option based off conditions and characteristics How can you decipher which is the most effective treatment option for a certain patient?
Important Figures	No figures in this article
VOCAB: (w/definition)	STS- systematic treatment selection RCT= randomized clinical trials

<p>Follow up Questions</p>	<p>What are other specific ways you could improve the accuracy of matching a patient with a treatment plan and how plausible would it be to implement that alongside STS?</p> <p>Is it feasible to consider every patient’s condition and specific characteristics or is there any way to simplify the process while still attaining the same results?</p> <p>How was STS initially idealized and for what purpose?</p>

Article #2 Notes: Automatic skin disease diagnosis using deep learning from clinical image and patient information

Article notes should be on separate sheets

Source Title	Automatic skin disease diagnosis using deep learning from clinical image and patient information
Source citation (APA Format)	Muhaba, K. A., Dese, K., Aga, T. M., Zewdu, F. T., & Simegn, G. L. (2021). Automatic skin disease diagnosis using deep learning from clinical image and patient information. <i>Skin health and disease</i> , 2(1), e81. https://doi.org/10.1002/ski2.81
Original URL	Automatic skin disease diagnosis using deep learning from clinical image and patient information - PMC (nih.gov)
Source type	Scientific Journal "Articles from International Journal of Clinical and Health Psychology"
Keywords	Clinical images, deep model learning, skin diseases, early detection
#Tags	#lowresource, #timesaving, #deeplearning, #binaryclassification
Summary of key points + notes (include methodology)	By utilizing clinical images and patients' information for five common skin conditions, this led to the deep learning model having an accuracy of close to 98% when it came to classifying the condition. As skin diseases are one of the most common causes of human illnesses, affecting close to 900 million people at any time in the world, it's crucial to be able to detect signs and patterns of skin diseases early on to come up with a treatment option. This article focuses on using CAD to collect clinical images and use that data to continue to improve the identification of skin diseases.
Research Question/Problem/Need	How can you use deep learning to aid in identifying skin conditions? *especially for low-resource areas where it's harder to see a dermatologist (this was designed into an app which makes it a lot more accessible)

Important Figures

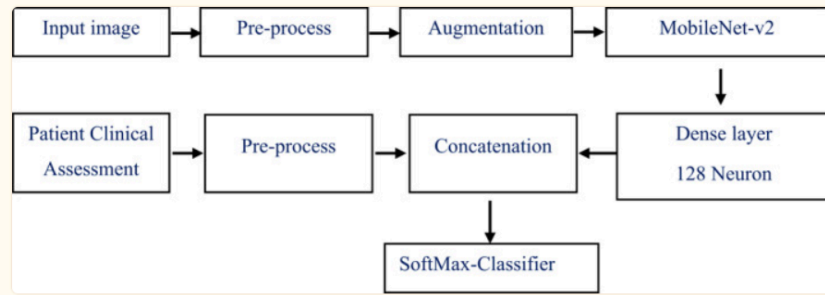

FIGURE 1

Block diagram of the skin disease multi-class classification system

- This diagram provides a clear step-by-step of the proposed system and how it would work to identify the skin condition through various processes. By having these steps in a diagram, I found it a lot easier to follow and make sense of.

Age-wise distribution of five skin diseases

Gender-wise distribution of the five skin diseases

- I think both of these bar graphs go together in providing more specific information regarding the five skin diseases in a visual way. Specifically, by highlighting the target ages and gender that gets affected by these conditions which I think is very useful to see through graphs instead of a number of tables.

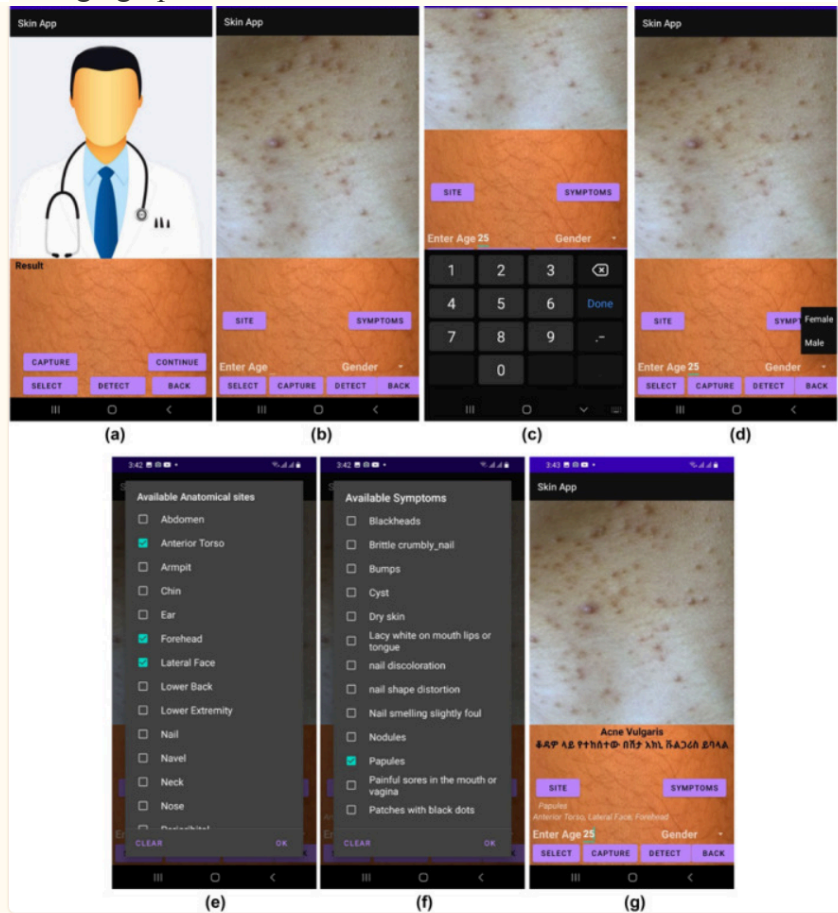

FIGURE 9

An android application used for diagnosing skin diseases using clinical image and patient information. (a) Home page of the App. (b) Image Capturing. (c) Age information. (d) Gender selection. (e) Anatomical site selection. (f) Symptom list selection. (g) Predicted skin disease

- This one gave a variety of pictures all showing the android application and it's functions. While it's nothing too specific, I find it's important to lay out all the different functions and options to better explain how the app works and how people can use it.

VOCAB: (w/definition)

CAD- computer-aided diagnosis
 Mobilenet-V2- deep-learning pretrained model designed to identify five common skin conditions

	SVM- support vector machine (proposed for classification of acne, eczema, psoriasis, benign, and malignant melanoma)

Follow up Questions	<p>What other kinds of experiments can be made to help improve the accuracy rate of these skin disease diagnosis machines?</p> <p>How could you expand this idea to fit more than just five common skin conditions, what factors would you have to consider?</p> <p>As you expand into more and more types of skin conditions, how would you collect and organize that data most efficiently?</p>

Article #3 Notes: Music Therapy Interventions for Deaf Clients with Dual Diagnosis

Article notes should be on separate sheets

Source Title	Music Therapy Interventions for Deaf Clients with Dual Diagnosis
Source citation (APA Format)	.Ward, Anna Johnson. "Music Therapy Interventions for Deaf Clients with Dual Diagnosis." <i>Voices: A World Forum for Music Therapy</i> 16, no. 3 (May 10, 2016). https://doi.org/10.15845/voices.v16i3.840 .
Original URL	View of Music Therapy Interventions for Deaf Clients with Dual Diagnosis Voices: A World Forum for Music Therapy
Source type	Research Article
Keywords	Deaf, language-dysfluency, vibrotactile feedback, music therapy, mental health, dual diagnosis, intellectual disability
#Tags	^^^
Summary of key points + notes (include methodology)	This article talks about using the concept of music therapy to aid Deaf people who have intellectual challenges and emotional or behavioral issues. As it discusses the principal connection between Deafness, music and its impact on mental health, and communication difficulties, this article emphasizes the value of interventions in music therapy that are specifically created for this demographic. The article also describes two case studies of music therapy sessions with Deaf patients who had "co-occurring disorders"s, going into detail on the objectives and strategies employed in these sessions to encourage emotional expression and coping mechanisms.
Research Question/Problem/Need	How can we use music therapy to aid Deaf people?
Important Figures	None to note

Article #4 Notes: How does music affect your brain?

Article notes should be on separate sheets

Source Title	How does music affect your brain
Source citation (APA Format)	published, Becks Shepherd. "How Does Music Affect Your Brain?" livescience.com, December 15, 2022. https://www.livescience.com/how-does-music-affect-your-brain .
Original URL	https://www.livescience.com/how-does-music-affect-your-brain
Source type	Science Article
Keywords	Deaf, language-dysfluency, vibrotactile feedback, music therapy, mental health, dual diagnosis, intellectual disability
#Tags	#dopamine, #cognitivefunction, #stresslevels
Summary of key points + notes (include methodology)	<p>This article addresses the influence of music on the brain and highlights a few significant ideas. Dopamine, the "feel-good" hormone, is released when you listen to music, and it can enhance cognitive performance, reduce anxiety and stress, and help you concentrate. Different musical genres stimulate the auditory cortex, limbic system, and motor cortex, among other brain regions. Music can assist with memory recall, and cognitive function, and may even help with depressive symptoms. By impacting the release of neurochemicals like serotonin and dopamine, it can also lower stress levels. Music has also been related to pain alleviation throughout</p>

	medical operations. The article does in fact point out that how you listen to music and the type you listen to can also affect your emotional state of mind and overall mood.
Research Question/Problem/Need	How does music affect the brain?
Important Figures	No figures included
VOCAB: (w/definition)	Dopamine- signaling molecule that acts as a chemical messenger in the nervous system and as a hormone that can affect many tissues in the body, associated with pleasure and happiness
Cited references to follow up on	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6397525/ (embedded in text)
Follow up Questions	How can we use this knowledge for future developments? What would those developments look like? What does knowing this allow for in the future?

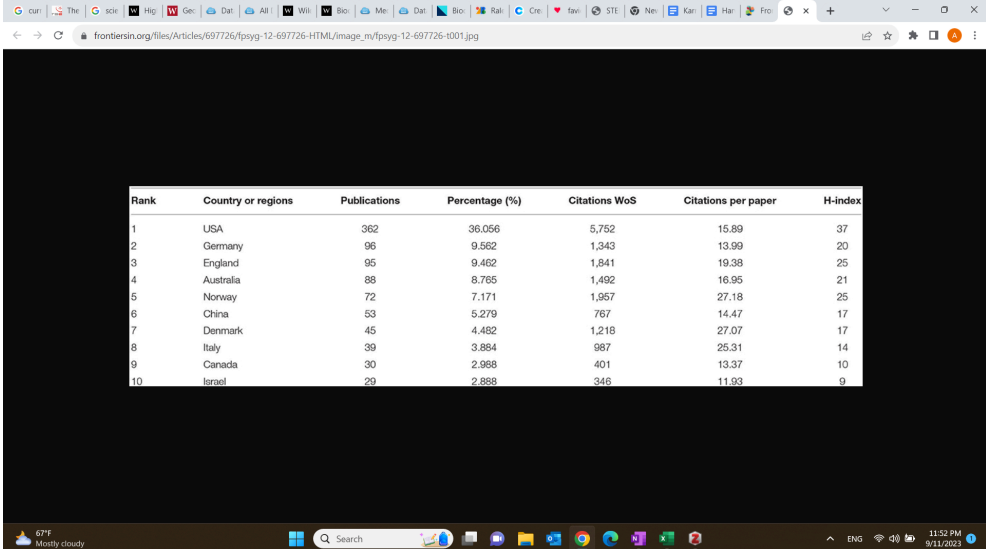

Article #5 Notes: The State of Music Therapy Studies in the Past 20 Years: A Bibliometric Analysis

Source Title	The State of Music Therapy Studies in the Past 20 Years: A Bibliometric Analysis
Source citation (APA Format)	Li, Kailimi, Linman Weng, and Xueqiang Wang. "The State of Music Therapy Studies in the Past 20 Years: A Bibliometric Analysis." <i>Frontiers in Psychology</i> 12 (2021). https://www.frontiersin.org/articles/10.3389/fpsyg.2021.697726 .
Original URL	https://www.frontiersin.org/articles/10.3389/fpsyg.2021.697726
Source type	Science "Review" Article
Keywords	Bibliometrics, global trends, research
#Tags	#musictherapy, #publications
Summary of key points + notes (include methodology)	This article focuses on the global trends in music therapy research between 2000 and 2019 through an approach known as "bibliometrics" analysis. As a whole, the article summarizes how music therapy essentially used evidence-based music intervention in order to address the different needs of individuals, whether it be physical, emotional, or cognitive. This article also analyzes various publications from the Web of Science database, specifically co-citations, collaborations, and trends. The number of publications on music therapy has grown significantly over the investigated period,

with the United States dominating in terms of the number of research published and citations obtained. There are new areas for investigation, such as improvisational music therapy (IMT), which has shown success in treating diseases like drug misuse, depression, and autism. Keywords like "efficacy," "health," and "older adults" also represent substantial research trends. The results of the study help to pinpoint unified networks, developing subjects, and prospective research trajectories in the area of music therapy.

Research Question/Problem/Need
 Did the overall trend of music therapy publications rise over the years?

Important Figures

Rank	Country or regions	Publications	Percentage (%)	Citations WoS	Citations per paper	H-index
1	USA	362	36.056	5,762	15.89	37
2	Germany	96	9.562	1,343	13.99	20
3	England	95	9.462	1,841	19.38	25
4	Australia	88	8.765	1,482	16.95	21
5	Norway	72	7.171	1,857	27.18	25
6	China	53	5.279	767	14.47	17
7	Denmark	45	4.482	1,218	27.07	17
8	Italy	39	3.884	987	25.31	14
9	Canada	30	2.988	401	13.37	10
10	Israel	29	2.888	346	11.93	9

This is a table showing the top 10 countries or regions of origin of study in the music therapy research field. I thought this was significant because it helped organize the data and paint a clearer picture of what they were talking about.

Article #6 Notes: Aligning Kitwood's Model of Person-Centered Dementia Care with Music Therapy Practice

Source Title	Aligning Kitwood's Model of Person-Centered Dementia Care with Music Therapy Practice
Source citation (APA Format)	Kelly, Lisa, Bill Ahessy, Ita Richardson, and Hilary Moss. "Aligning Kitwood's Model of Person-Centered Dementia Care with Music Therapy Practice." <i>Music Therapy Perspectives</i> , July 7, 2023, miad015. https://doi.org/10.1093/mtp/miad015 .
Original URL	https://academic.oup.com/mtp/advance-article/doi/10.1093/mtp/miad015/7221285?searchresult=1
Source type	Journal Article
Keywords	Dementia, communicative musicality, collaboration
#Tags	#personcenteredcare, #musicengagement, #qualityoflife
Summary of key points + notes (include methodology)	This article covers the transformation in dementia care from a medical paradigm to person-centered care, with a strong emphasis on Tom Kitwood's concepts. Kitwood places a strong focus on developing personality, understanding the individual's perspective, and catering to their psychological needs. In line with this strategy, music therapy promotes person-centered care by targeting needs, encouraging teamwork, and promoting emotional expression. By using relaxation, stimulation, and validation, person-centered music therapy (PCMT) approaches and is helpful for people with dementia. They discuss the incorporation of PCMT in dementia care, stressing how it has the capacity to improve well-being and enhance person-centered strategies by focusing on the individual's unique circumstances and needs.

Research Question/Problem/Need	What is the best way to offer care to patients with dementia?
Important Figures	None that I noted.

Article #7 Notes: Short-Term and Long-Term Effects of Orthopedic Biodegradable Implants

Article notes should be on separate sheets

Source Title	Short-Term and Long-Term Effects of Orthopedic Biodegradable Implants
Source citation (APA Format)	Amini, Ami R., James S. Wallace, and Syam P. Nukavarapu. "Short-Term and Long-Term Effects of Orthopedic Biodegradable Implants." <i>Journal of Long-Term Effects of Medical Implants</i> 21, no. 2 (2011): 93–122.
Original URL	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3470866/#:~:text=Non%2Dpermanent%2C%20biodegradable%20implants%20offer,the%20need%20for%20secondary%20surgeries.
Source type	Scientific Journal
Keywords	biodegradable, orthopedic biomaterials, foreign body reaction, inflammation, fibrosis
#Tags	#foundation #initialresearch
Summary of key points + notes (include methodology)	<ul style="list-style-type: none"> - Biodegradable implants that are non-permanent, better alternative, temporary support, degrade at a rate matching tissue formation, eliminating need for secondary surgeries - Financial, psychological, clinical advantages in comparison to permanent medical implants - Metallic implants cost more for removal, making them a more expensive option, resorbable/biodegradable implants seven hundred dollars less per metallic implant - Often, metallic implants are too stiff/strong for most efficient bone healing, causes stress shielding (reduction in bone density caused by stress from an implant) - Study conducted by Mittal et al. found that 90 percent of patients found the biggest drawback of metal implants to be revision/removal surgeries

- Therefore, resorbable implants= decreased expenses and decreased recovery time
- Psychological impact from implant removal surgeries...added trauma, increases stress on patient and family
- Resorbable implants= decreased stress shielding and lack of interference with imaging techniques
- RI (resorbable implants can also be used as drug releasing devices*** (interested in doing more research on this), encapsulated with growth factors and antibiotics, potential to speed up recovery while preventing infections
- Biodegradable polymers are also known as bioresorbable or bioabsorbable polymers
- Commonly known- PGA (polyglycolide) and PLLA (polylactide) attracted much attention from orthopedic device community, excellent biocompatibility and tunable physical and degradation properties
- Looking into developing implants that incorporate biopolymers (collagen and hyaluronic acid), combined with nano-hydroxyapatite or tri-calcium phosphate to create implants with bone-like composition
- Mainly on screws, there's a lot of data available on biodegradable implants
- "Surgical implantation of a biomaterial, regardless of its being inert and nontoxic, will initiate the on-set of a foreign body reaction"
- Currently under development (meaning I can do more research if I chose)-scaffolds for bone tissue engineering, and cements and gels for bone defect filling
- "histamine release by mast cells triggers the rapid migration of inflammatory cells, such as neutrophils and monocytes, towards the implanted biomaterial, and progression of a FBR"
- Didn't focus on methodology for this article, just provided me with more background information

**Research Question/Problem/
Need**

(used this article to provide background information on a new topic)

<p>Important Figures</p>	 <p>FIGURE 1</p> <ul style="list-style-type: none"> - This figure helped provide visual depictions of commonly used implants and what they are mainly used for
<p>VOCAB: (w/definition)</p>	<ul style="list-style-type: none"> - stress shielding (reduction in bone density caused by stress from an implant) - Resorbable implants- synonymous with biodegradable implants, made with degradable material
<p>Cited references to follow up on</p>	<p>https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6397525/ (embedded in text)</p>
<p>Follow up Questions</p>	<p>I still have a lot of questions on how exactly biodegradable implants can also work as drug carriers to help speed up recovery time while preventing infections. I think that could be really cool to look into because I never knew that was possible and that could definitely be a huge help for people who require medical implants.</p> <p>I had the main question from this section, how could you collect data on degradation rates of different polymers to help identify which materials are more efficient for different kinds of implants</p> <p>Later, I had the idea that I could do my own data in a lab by submerging different implant materials into simulated body fluids and recording their degradation rates as a way of collected data on the subject and using that to aid in my conclusions of which material is best</p> <p>What is the main thing I want to figure out in the next week or two is where I want to go with this project. After doing some research, this topic is really interesting and there's a lot of resources out there that keep fueling my interest. I want to commit to this topic and figure out what direction I'm trying to go with it because right now, I haven't decided and I'm a little stuck. I think with more research and using my brainstorming strategies (fishbone diagrams, mind maps), I can refine my topic into something more attainable for my science fair project.</p>

Article #8 Notes: **This biodegradable brain implant delivers cancer-treating drugs**

Source Title	This biodegradable brain implant delivers cancer-treating drugs
Source citation (APA Format)	Whooley, Sean. "This Biodegradable Brain Implant Delivers Cancer-Treating Drugs." Drug Delivery Business, July 13, 2023. https://www.drugdeliverybusiness.com/biodegradable-brain-implant-delivers-cancer-treating-drugs/ .

Keywords	Olanzapine, implant, 3D-printing, sustained delivery
#Tags	#testingstrategy, #using3DModels
Summary of key points + notes (include methodology)	<p>Background/Context:</p> <ul style="list-style-type: none"> ● development of implantable drug delivery devices using 3D printing technology ● implants are typically classified in two categories (matrix-type and reservoir-type) <ul style="list-style-type: none"> ○ matrix-type- the drug is homogeneously dispersed ○ reservoir-type- the drug is located at the core of the implant and release of drug is controlled by a membrane (reference from Stewart et Al in 2020) <ul style="list-style-type: none"> ■ no initial burst drug release ■ disadvantage- membranes typically created by non-biodegradable polymers (why is this a problem? Second surgery) ● meant to release the hydrophobic drug olanzapine (OLZ) (medication for schizophrenia) over an extended period

- Implantable drug delivery systems =potential to revolutionize the treatment of various medical conditions
 - sustained and controlled drug release.

Problem Being Solved:

- The primary challenge= create implantable devices—>effectively deliver OLZ
 - hydrophobic (water repellent) drug (known for its efficacy against against certain diseases)
 - used in the treatment of conditions such as schizophrenia and anorexia, over an extended period
 - deliver OLZ without an initial burst release (happens during early stages of drug delivery, large amounts of the drug get released rapidly)
 - To accomplish this goal, required a combination of 3D printing techniques and rate-controlling membranes (provides a specific rate of drug release)
 - indicating that they wanted to create a reservoir-type implant
- Benefit of this- patient-tailored implants (because of approach's flexibility and controllability) (reference from khaled et al. in 2014)
 - Treatment could match individual patient and condition, more personalized which is beneficial to patients

Testing Strategies and Methods:

tests + experiments to ensure the drug delivery implants were put together correctly + the drug would be released the way it was meant to

- Drug release was studied for 6 months using...
- Microscopy Study: looked at implants under microscope to see how well drug was distributed throughout them
 - checked shape +size of the drug crystals to ensure everything was mixed properly
- Differential Scanning Calorimetry and Thermogravimetric Analysis (DSC-TGA): Specific machines to heat up + measure how implants reacted
 - helped them understand if there were any changes in the structure of the implants when the drug was added.
- Fourier Transform-Infrared Spectroscopic Analysis (FTIR): another machine that shone light on the implants to see how the different materials in them interacted
 - helped to check if there were any chemical reactions happening.
- X-ray Diffraction Assay (XRD): X-rays to see how the crystals in the implants were arranged
 - helped figure out the exact form of the drug inside the implants.
- Implant Assembly: special technique called Optical Coherence Tomography (OCT)

- look inside the implants without opening them up
- could see how well the outer coating stuck to the implants.

Results: findings of study-

- Both implant formulations (50% and 80% OLZ) == sustained drug release over 190 days
 - without initial burst release when coated with a PCL-based membrane (PCL- Polycaprolactone- biodegradable polyester)
- Implants with 50% OLZ have a faster initial release rate and then a gradual decline
 - But implants with 80% OLZ maintain a constant release rate over the entire duration
- Higher amounts of OLZ- higher viscosity formulations
 - Better-defined geometry (thinner)
 - Mixture did not flow when extruded
 - Formulation with 50% has lower viscosity, broader implants
- Cytocompatibility testing (property of not being harmful to cells) confirms that the PCL-based membranes used in the devices are safe for human cells.

Conclusions:

- the study demonstrates the feasibility of 3D printing technology for creating implantable drug delivery devices
 - capable of sustained hydrophobic drug release
 - devices have potential applications in various medical conditions

Future research:

- further research, including animal studies, is needed to ensure their safety + effectiveness
- study highlights need for addressing sterilization, quality control, and reproducibility aspects before considering clinical use
 - FDA actively works on providing guidance for researchers and companies in the field

**Research Question/Problem/
Need**

Keywords	Drug delivery device, women's health
#Tags	#implications, #drugdeliveringsystem
Summary of key points + notes (include methodology)	Researchers are making exciting strides in the development of 3D printed drug delivery devices tailored for women's health. Employing technologies like FDM and materials such as polyurethane, studies have crafted implants with unique designs, like cone-shaped cervix tissue implants and porous structures, addressing challenges in drug loading for prolonged release. For biodegradable implants, polycaprolactone (PCL) and polylactic acid (PLA) show promise, especially with PCL's longer degradation suitable for extended applications. However, assessing mechanical properties consistently remains a gap, hindering insights into implant functionality. Despite solid-state characterization and drug release studies being common, inconsistencies in testing conditions make cross-study comparisons challenging. Regulatory bodies are actively working to establish guidelines, including the FDA and MHRA, recognizing the need for standards in this innovative

	<p>field. The future beckons for optimizing process parameters and addressing regulatory challenges to unlock the full potential of 3D printed drug delivery systems, particularly in the realm of women's health.</p> <p>*Chat GPT Prompt: Please use the four parts of the same text to write a one-paragraph summary at a senior in highschool levels</p>

Summary of key points + notes (include methodology)	<p>In this study, scientists have developed a compact drug delivery system for biomedical use. The system involves an electrolytic pump and microneedles, and a special 3D printing technique was used for fabrication. The microneedles demonstrated a controlled flow rate at different pressures, and the entire system, measuring only 3.9 mm ´ 2.1 mm ´ 2 mm, efficiently delivered 4 ± 0.5 µL within 12 seconds. The microneedles also showed promise for transdermal delivery through a skin-like material. This research represents a significant advancement in drug delivery, providing a miniature and precise method for targeted drug release, overcoming limitations of traditional delivery approaches.</p> <p>*Chat GPT Prompt: Please use the text to write a one-paragraph summary at a senior in highschool levels</p>

Original URL	https://www.aidic.it/cet/20/78/094.pdf
Source type	Scientific Journal
Keywords	Pineapple waste, bacterial cellulose production
#Tags	#alternativesource, #pineapple
Summary of key points + notes (include methodology)	<p>This research explores the use of pineapple waste to produce a special material called bacterial cellulose, created by <i>Acetobacter xylinum</i> bacteria. The scientists investigate how factors like temperature, acidity (pH), and the concentration of pineapple waste affect the production of bacterial cellulose. They conduct experiments to find the best conditions, discovering that optimal results occur at pH 5.50, temperature 30°C, and 80% pineapple waste concentration, yielding 3.3948g of bacterial cellulose. Further refinement using response surface methodology identifies even better conditions: pH 5.15, temperature 30.51°C, and 83.32% concentration, resulting in 3.4368g of bacterial cellulose. Tests confirm the presence of bacterial cellulose using Fourier Transform Infrared Spectroscopy. This study emphasizes the potential of using pineapple waste for eco-friendly bacterial cellulose production, which could have practical applications in sustainable materials.</p> <p>*This was generated by Chat Prompt: Write a paragraph long summary of the text at a senior in highschool level</p>

Source type	Scientific Journal
Keywords	Pineapple waste, acidity, <i>Acetobacter Xylinum</i>
#Tags	#testingstrategies
Summary of key points + notes (include methodology)	<p>This study aimed to make bacterial cellulose (Nata) from pineapple waste using a bacterium called <i>Acetobacter xylinum</i>. They tested two ways of growing it: one where it sits still (static) and one where it's stirred (agitated). Stirring it at a moderate speed with tiny particles (glass beads) added resulted in the most cellulose. The researchers discovered that yeast extract and potassium dihydrogen phosphate are crucial for making a lot of bacterial cellulose. They then figured out the best amounts for these ingredients, along with yeast extract, sucrose, and bactopecton, resulting in a 70.23% increase in bacterial cellulose compared to the static method. They also found that magnesium sulfate doesn't matter for this process. Using pineapple waste is great because it's a way to use up waste and be more environmentally friendly. This research helps us understand how to efficiently make a lot of bacterial cellulose from pineapple waste.</p> <p>Prompts: Please write a paragraph long summary of that text</p>

	simplify this to a senior in highschool level
Research Question/Problem/Need	Can pineapple waste be used as an alternative carbon source for the production of bacterial cellulose?
Important Figures	 <p>This figure provides a good summary of the importance of the data collected by comparing the concentration of pineapple waste and its correlation with the yield of cellulose.</p>

Keywords	bacterial cellulose, <i>Komagataeibacter</i> , biomaterial, nanocomposite
#Tags	#bacterialcellulose #background
Summary of key points + notes (include methodology)	The article discusses the production and modification of bacterial cellulose, a versatile biological material, by different strains of <i>Komagataeibacter</i> bacteria. Various strains were analyzed for cellulose yield and membrane properties. Ethanol supplementation significantly influenced yield, and strains with and without ethanol were compared. Three promising strains were identified for further research. The study also explored the modification of bacterial cellulose by adding compounds like citrus pectin, apple pectin, wheat starch, polyvinyl alcohol, and polyethylene glycol. These modifications affected the material's properties, making it suitable for diverse applications, including wound dressings, drug delivery, and packaging. The article emphasizes the importance of strain selection and modifications in tailoring bacterial cellulose for specific purposes.

Summary of key points + notes (include methodology)	<p>Bacterial cellulose (BC) holds great promise across various fields. In the biomedical realm, BC is a key player in crafting artificial blood vessels and heart valves, showing advantages over traditional grafts. It also demonstrates potential in bone tissue engineering, offering a scaffold for cell growth and differentiation. BC's versatility extends to food applications, being deemed safe by the FDA. It contributes to the delightful texture of the Filipino dessert "nata-de-coco" and aids in creating fat-free or low-calorie foods. BC finds a place in cosmetics, where its nonallergenic nature makes it a valuable component in facial masks for moisturizing and cosmetic effects. The electronic field benefits from BC's fibrous structure, utilizing it in conductive membranes, biosensors, and batteries. Water purification sees BC in action through composite membranes for effective removal of pollutants. Additionally, BC has roles in paper manufacturing, textiles, enzyme immobilization, and more. Commercially, various BC-based products are already available, and ongoing research aims to enhance its properties and reduce production costs. Challenges like biodegradability are recognized, urging future research to unlock BC's full potential.</p> <p>*Chat GPT Prompt: Please use the three parts of the same text to write a one paragraph summary at a</p>

Keywords	Komagataeibacter xylinus, BC Production, kombucha
#Tags	#testingmethod, #alternativefoodsource
Summary of key points + notes (include methodology)	The study investigated the use of apple waste and a tea mixture as alternative feedstocks for bacterial cellulose (BC) production, a versatile material with potential applications in various industries. Researchers explored the combination of apple waste from Bravo de Esmolfe apples and a tea mixture as carbon and nitrogen sources, respectively, using a microbial consortium from kombucha. The results showed that, despite lower yields compared to the control using synthetic media, increasing the concentration of apple waste in the media led to higher BC production, especially in the TM-10AW medium. The study also assessed the optical properties, morphology, water holding and retention abilities, chemical composition, and crystallinity of the produced BC. The findings indicated promising outcomes for the TM-10AW medium, suggesting it as a cost-effective alternative for large-scale BC production, potentially widening its applications in fields such as biomedicine, food, packaging, textiles, and electronics.

Source type	Scientific Journal
Keywords	Biopolymers, bacterial cellulose, biocomposites, fruit juices polyhydroxyalkanoates, polylactic acid, ultrasound-assisted biosynthesis
#Tags	#fruitjuices #testingstrategy
Summary of key points + notes (include methodology)	In this scientific study, researchers investigated the production of bacterial cellulose (BC) using watermelon and mandarin juices as growth media. The impact of ultrasound treatment on BC properties was explored, revealing changes in fibril dimensions, surface roughness, and crystallinity. The study aimed to achieve high BC yields by varying cultivation conditions, including static, dynamic, and semidynamic modes with ultrasound assistance. Notably, watermelon and mandarin juices proved effective as growth media for <i>Komagataeibacter xylinus</i> bacteria, with comparable BC yields to synthetic media. Ultrasound treatment exhibited promising effects, such as improved fibril diameters and pore sizes, though with a slight decrease in crystallinity. The study emphasizes the potential use of food waste, like fruit juices, for sustainable biopolymer production and discusses challenges and future considerations for scaling up the process. Overall, the research sheds light on optimizing BC production methods and highlights its

Patent #1 Notes: Method for fermented-producing bacteria cellulose with pineapple peel juice by two-step method

Article notes should be on separate sheets

Source Title	Method for fermented-producing bacteria cellulose with pineapple peel juice by two-step method
Source citation (APA Format)	刘冬梅, 吴晖, and 于淑娟. Method for fermented-producing bacteria cellulose with pineapple peel juice by two-step method. China CN101671708A, filed October 19, 2009, and issued March 17, 2010. https://patents.google.com/patent/CN101671708A/en .
Original URL	https://patents.google.com/patent/CN101671708A/en
Source type	Google Patent
Keywords	Pineapple juice, 2-step method, fermented-producing bacteria, bacterial cellulose
#Tags	#patent, #similarmethod, #testingstrategy
Summary of key points + notes (include methodology)	<p>The innovative method described in the text offers a more efficient and cost-effective approach to producing bacterial cellulose using pineapple peel juice. Unlike traditional methods, this two-step fermentation process optimizes the activation and multiplication of <i>Acetobacter xylinum</i>, a key bacterium involved in cellulose production. By carefully controlling the nutrient composition, including the use of pineapple peel juice and <i>Sucus Cociois</i>, the method not only reduces production costs but also transforms waste into a valuable resource. The scientific approach to nutrient matching, involving K⁺, Na⁺, Ga²⁺, Mn²⁺, Mg²⁺, Fe²⁺, and somatotropin, contributes to a remarkable bacterial cellulose output exceeding 17.5g/L (dry basis). Moreover, the method shortens the production cycle, minimizes environmental impact, and ensures stability in product quality, making it suitable for large-scale production with significant reductions in costs and increased output. The provided embodiments illustrate the successful application and consistency of this innovative approach across different scenarios.</p> <p>*Chat GPT Prompts:</p>

#Tags	#alternativesource, #testingstrategy
Summary of key points + notes (include methodology)	<p>This invention introduces a novel method for producing bacterial cellulose, a special kind of cellulose with diverse industrial applications, using waste materials from mushroom production. Unlike traditional methods that are costly and involve complex processes, this approach makes use of by-products like mushroom beds and stone remnants to create a medium for cultivating cellulose-producing bacteria. The resulting bacterial cellulose has unique properties and can be used in various industries, ranging from medical pads to papermaking. This method not only reduces production costs but also contributes to sustainability by repurposing waste from mushroom cultivation. The study shows promising results, indicating that this innovative technique could offer a more economical and eco-friendly way to produce bacterial cellulose.</p> <p>*Chat GPT Prompt: Please use the text to write a one-paragraph summary at a senior in highschool levels</p>

Summary of key points + notes (include methodology)	<p>The text discusses the production of sisal fibers modified with bacterial cellulose (BC) and the creation of eco-friendly composites using BC with water-soluble polymers. In the first part, the study shows that coating sisal fibers with BC enhances their strength. The second part describes the development of 'green' composites by immersing BC in solutions of polyvinyl alcohol (PVA) and polyethylene oxide (PEO), resulting in improved mechanical properties. The third part presents detailed analyses, including tensile testing and spectroscopy, confirming the enhanced characteristics of these BC-based composites. Overall, the study suggests that BC modification improves the properties of natural fibers and contributes to the development of sustainable materials.</p> <p>*Chat GPT Prompt: Those are the three parts of one article, copy and pasted in order. Please write a summary at a senior in highschool level summary</p>
Research Question/Problem/Need	How can bacterial cellulose be produced in a way that is more eco-friendly and overall, a more sustainable approach to producing the cellulose?

Important Figures

FIG. 1

FIG. 2

These figures provide a visual representation of how the BC yield is dependent on the culture time, and how more days of culturing affects how much is grown.

VOCAB: (w/definition)

Resins- used in polymer chemistry, highly viscous substance of synthetic or plant origin
 Agar plates- petri dish that has a growth medium in it, used to culture microorganisms

Follow up Questions

Are there potential drawbacks or limitations to BC coating on natural fibers?

Are there other natural fibers that exhibit similar improvements in IFSS when coated with BC?
