Introduction: Wave Optics February 2024

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Temporal coherence

- Review interference equation: Lecture 04
- Michelson interferometer to test for coherence length (temporal)

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Temporal coherence

Assume 100% flat and orthogonal mirrors

Detected intensities as a function of position of movable mirror

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Temporal coherence

Temporal coherence describes the self-correlation of a wave. Consider the normalized autocorrelation function

$$g(\tau) = \frac{G(\tau)}{G(0)} = \frac{\left\langle U^*(t) U(t+\tau) \right\rangle}{\left\langle U^*(t) U(t) \right\rangle},$$
(1)

where τ is the time delay, related optical path length changes introduced by the movable mirror.

Equation 1 is called the **degree of temporal coherence** with

$$0 \le \left| g(\tau) \right| \le 1. \tag{2}$$

Usually, $|g(\tau)|$ drops from its largest values $|g(\tau)| = 1$ as τ increases and the fluctuations become uncorrelated for sufficiently large time delay τ .

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Temporal coherence

Coherence length is defined as

$$l_c = c \, \tau_c \; , \tag{3}$$

where c is the speed of light and τ_c is the power equivalent width of the function $|g(\tau)|$ given as

$$\tau_c = \int_{-\infty}^{\infty} |g(\tau)|^2 d\tau \,. \tag{4}$$

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Wave optics: coherence Temporal coherence

Magnitude of the degree of temporal coherence $|g(\tau)|$

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Temporal coherence

Power spectral density: $S(v) = \int_{-\infty}^{\infty} g(\tau) \exp(-j2\pi v \tau) d\tau$

Spatial coherence Young's double pinhole interferometer

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology CHSLT - Center for Holographic Studies and Laser micro-mechaTronics

Wave optics: coherence Spatial coherence

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Speckle pattern observed on the flat surface of an object illuminated with a coherent light source with characteristic wavelength $\lambda = 994.1$ nm and horizontally polarized. Average surface roughness is 5 μ m, object distance is 30 mm, and f/2.8 aperture is used. The surface is illuminated and observed normal to the plane where the surface lies.

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Illumination and scattering geometry from surfaces defined as $\zeta = \zeta(x, y)$ and $\zeta = \zeta(x)$.

Vectors of illumination and scattering: $\mathbf{K}_1 = k \hat{K}_1$, $\mathbf{K}_2 = k \hat{K}_2$

Scattering from a smooth surface

 $\hfill The complex amplitude of the scattered light, <math display="inline">F_o$, at point p, can be predicted using the Kirchoff integral theorem

$$F_o = \frac{1}{4\pi} \left\{ \iint_{s} \frac{1}{r} \exp(-jkr) \nabla U \cdot d\mathbf{S} - \iint_{s} U \nabla \left[\frac{1}{r} \exp(-jkr) \right] \cdot d\mathbf{S} \right\}$$
(5)

which is derived from the Helmholtz equation.

□ For a smooth surface, $\zeta(x) \approx 0$, extending from [-L, L]:

$$F_{o} = F_{o}(\theta_{1}, \theta_{2}) = \frac{\sin[kL(\sin\theta_{1} - \sin\theta_{2})]}{kL(\sin\theta_{1} - \sin\theta_{2})}$$
(6)
$$= \sin c \left[\frac{2\pi}{\lambda} L(\sin\theta_{1} - \sin\theta_{2}) \right]$$

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Scattering from a smooth surface

 \square Scattering diagram for a smooth surface characterized by the ratio λ/L .

 $\hfill\square$ Note that when $\lambda/L \to 0$ scattering of light concentrates in the direction of specular reflection

Scattering from a surface characterized by a periodic function:

$$A = 10\lambda, \quad \theta_{l} = \pi/4, \quad \lambda/h = 0.033$$

$$A = 10\lambda, \quad \theta_{l} = \pi/4, \quad \lambda/h = 0.066$$

$$A = 10\lambda, \quad \theta_{l} = \pi/4, \quad \lambda/h = 0.066$$

$$A = 10\lambda, \quad \theta_{l} = \pi/4, \quad \lambda/h = 0.066$$

$$A = 10\lambda, \quad \theta_{l} = \pi/4, \quad \lambda/h = 0.066$$

$$A = 10\lambda, \quad \theta_{l} = \pi/4, \quad \lambda/h = 0.066$$

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Scattering from a surface characterized by a periodic function

$$A = I0\lambda, \quad \theta_{I} = \pi/4, \quad \lambda/h = 1.0$$

$$A = I0\lambda, \quad \theta_{I} = \pi/4, \quad \lambda/h = 10.0$$

$$A = I0\lambda, \quad \theta_{I} = \pi/4, \quad \lambda/h = 10.0$$

$$A = I0\lambda, \quad \theta_{I} = \pi/4, \quad \lambda/h = 10.0$$

$$A = I0\lambda, \quad \theta_{I} = \pi/4, \quad \lambda/h = 10.0$$

$$A = I0\lambda, \quad \theta_{I} = \pi/4, \quad \lambda/h = 10.0$$

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Scattering from a surface characterized by a random function

Transition from specular to diffuse scattering reflection as a function of surface roughness:

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Speckle properties: first order statistics

Sum of N complex amplitude components:

$$U(x, y, z) = \frac{1}{\sqrt{N}} \sum_{k=1}^{N} |A_k| \exp[j\phi_k(x, y, z)]$$
(7)

Real an imaginary components:

$$\Re\{U\} = \frac{1}{\sqrt{N}} \sum_{k=1}^{N} \left|a_{k}\right| \cos(\phi_{k})$$

$$\Im\{U\} = \frac{1}{\sqrt{N}} \sum_{k=1}^{N} \left|a_{k}\right| \sin(\phi_{k})$$
(8)

Amplitude and phase are statistically independent.

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Speckle properties: first order statistics

Probability distribution for the intensity is (mean = $2\sigma^2$, variance = $\langle I^2 \rangle$)

$$P_{I}(I) = \int_{-\pi}^{\pi} P_{I,\phi}(I,\phi) d\phi = \begin{cases} \frac{1}{2\sigma^{2}} \exp\left(-\frac{I}{2\sigma^{2}}\right) & ; \quad I \ge 0\\ 0 & ; \text{ otherwise} \end{cases}$$
(9)

Probability distribution for the phase is:

$$P_{\phi}(\phi) = \int_{0}^{\infty} P_{I,\phi}(I,\phi) dI = \begin{cases} \frac{1}{2\pi} & ; -\pi \le \phi \le \pi \\ 0 & ; \text{ otherwise} \end{cases}$$
(10)

Mechanical Engineering Department/NEST - NanoEngineering, Science, and Technology

Speckle properties: second order statistics

Observed speckle size is (without imaging system):

$$\delta x_s = 2 \frac{\lambda z \pi}{L} \tag{11}$$

Speckle field formation without imaging system

Speckle properties: second order statistics

Observed speckle size is (with imaging system):

$$\delta r_{s} = 2.44 \frac{\lambda z}{D}$$
(12)

Speckle field formation with imaging system
