

# Project Notes:

## Inhibition of Gliadin- $\alpha$ 2 Binding to HLA-DQ2.5 Using Novel Chemical Synthesis

Derek Desrosiers

**Note Well:** There are NO SHORT-cuts to reading journal articles and taking notes from them. Comprehension is paramount. You will most likely need to read it several times, so set aside enough time in your schedule.

## Knowledge Gaps:

This list provides a brief overview of the major knowledge gaps for this project, how they were resolved and where to find the information.

Knowledge Gap	Resolved By	Information is located	Date resolved
Pathology of CD	Youtube videos	Various videos found on youtube (did not put them in project notes) <a href="#">Link 1</a> <a href="#">Link 2</a> <a href="#">Link 3</a> <a href="#">Link 4</a>	9/12/23
Proteins involved in TCR reception	Literature reading	Article 13	10/10/23
Why all foods don't cause an immune response	Prof. Stern	Didn't use any online information or papers, but answer is contained <a href="#">here</a>	10/13/23
Peptide sequences bound to HLA-DQ2.5	Google search (below)	Articles 15 and 18	11/15/23

## Literature Search Parameters:

These searches were performed between 08/29/2023 and 12/15/2023.

List of keywords and databases used during this project.

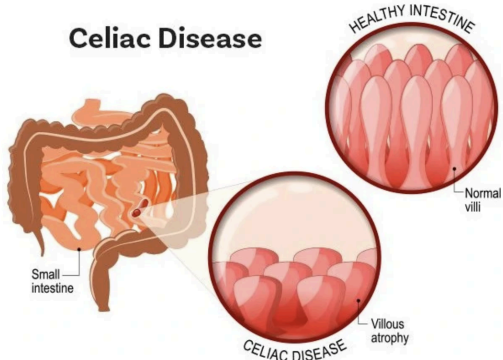

Database/search engine	Keywords	Summary of search
Scopus.org	TITLE-ABS-KEY ( celiac AND disease AND nsaid ) AND ( LIMIT-TO ( EXACTKEYWORD , "celiac disease" ) OR LIMIT-TO ( EXACTKEYWORD , "nonsteroid antiinflammatory agent" ) ) AND ( LIMIT-TO ( DOCTYPE , "ar" ) )	Found one article, otherwise did not come back to this search
Google.com	"Celiac disease pathology"	Founds lots of videos that proved helpful for basic information (what I was looking for)
Google.com	"tTG-modified gliadin peptides"	Used to find articles that contain peptide sequences both unmodified and modified by tTG
National Library of Medicine	"HLA-DQ2.5"	Used to find articles about the specific HLA I was using to study, also found some peptide sequences

<b>Source type</b>	General article
<b>Keywords</b>	Celiac disease, gluten, villi, autoimmune disorders
<b>#Tags</b>	#INTRODUCTION
<b>Summary of key points + notes (include methodology)</b>	Celiac disease is a serious autoimmune disease that occurs in genetically predisposed people where the ingestion of gluten leads to damage in the small intestine. Currently, the only treatment for celiac disease is strict adherence to a gluten-free diet. Celiac disease can also lead to iron deficiency anemia, small intestine cancer, vitamin and mineral deficiencies, and heart disease. <a href="#">☰ What is Celiac Disease? [notes]</a>
<b>Research Question/Problem/Need</b>	What is celiac disease?
<b>Important Figures</b>	 <p>The diagram, titled "Celiac Disease", shows a human silhouette with the small intestine highlighted. Two circular insets provide a microscopic view of the intestinal lining. The top inset, labeled "HEALTHY INTESTINE", shows "Normal villi" which are tall, finger-like projections. The bottom inset, labeled "CELIAC DISEASE", shows "Villous atrophy", where the villi are significantly shorter and flattened. The caption below the diagram reads "Diagram depicting effect of CD on".</p>

	the small intestine and the villi.

<b>Source type</b>	Journal article
<b>Keywords</b>	Permeability, gastrointestinal tract, diet, phosphorylation, NSAIDs, small intestine, histology, gene expression
<b>#Tags</b>	#INTRODUCTION #PROCEDURE #NSAID
<b>Summary of key points + notes (include methodology)</b>	<p>Gliadin, a component of wheat gluten known to be an important factor in the cause of celiac disease, was investigated with the significance of non-steroidal anti-inflammatory drug (NSAID)-induced small-intestinal damage in mice. It was shown that gliadin increased the intestinal paracellular permeability both with and without indomethacin administration. Gliadin induced phosphorylation of epidermal growth factor receptor (EGFR) in small-intestinal tissues caused the permeability exacerbated by gliadin.</p> <p> Involvement of gliadin, a component of wheat gluten, in increased intestinal...</p>
<b>Research Question/Problem/Need</b>	Does gliadin affect the permeability of NSAID-induced small-intestinal damage in mice?

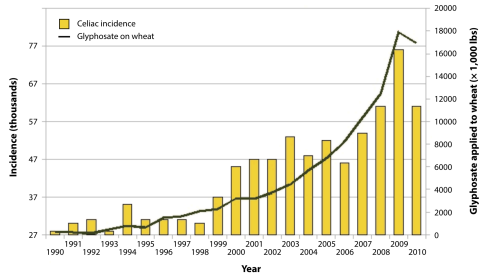

<b>Important Figures</b>	 <p>Graph showing effect of gliadin on small-intestinal permeability without and with indomethacin administration determined according to relative ratios of the concentration of serum fluorescein isothiocyanate (FITC)-dextran.</p>
<b>VOCAB: (w/definition)</b>	<p>Non-steroidal anti-inflammatory drugs: aspirin, ibuprofen</p> <p>Pathogenic: disease-causing</p> <p>Indomethacin: nonsteroidal anti-inflammatory drug (NSAID) used to treat mild to moderate acute pain and relieve symptoms of arthritis or gout, such as inflammation, swelling, stiffness, and joint pain</p> <p>Diclofenac: NSAID that can treat pain, migraines, and arthritis in its oral form. It can also treat actinic keratoses in its topical form</p> <p>Prophylactically: guarding from or preventing the spread or occurrence of disease or infection</p>

<b>Source type</b>	General article
<b>Keywords</b>	Celiac disease, gluten, genetically modified organisms, glyphosate
<b>#Tags</b>	#INTRODUCTION
<b>Summary of key points + notes (include methodology)</b>	<p>A recent report highlights a potential link between genetically modified organisms (GMOs) and gluten sensitivity, impacting an estimated 18 million Americans. The report suggests GMOs might contribute to conditions such as imbalanced gut bacteria, immune activation, impaired digestion, and damage to the intestinal wall. Glyphosate, a commonly used herbicide in GMO farming, is also implicated due to its potential to harm beneficial gut bacteria, which is associated with gluten-related disorders.</p> <p><a href="#">Can genetically modified foods trigger gluten sensitivity? [notes]</a></p>
<b>Research Question/Problem/Need</b>	Can genetically modified foods trigger gluten sensitivity?
<b>Important Figures</b>	none
<b>VOCAB: (w/definition)</b>	Glyphosate: patented antibiotic that destroys beneficial gut bacteria; used as a weed killer
<b>Cited references to follow up on</b>	none

<b>Source type</b>	Journal article
<b>Keywords</b>	Celiac disease, gluten, glyphosate, food, cytochrome P450, deficiency
<b>#Tags</b>	#INTRODUCTION #METHODOLOGY
<b>Summary of key points + notes (include methodology)</b>	<p>This study serves to show how glyphosate affects celiac disease. This include (1) disrupting the shikimate pathway, (2) altering the balance between pathogens and beneficial biota in the gut, (3) chelating transition metals, as well as sulfur and selenium, and (4) inhibiting cytochrome P450 enzymes.</p> <p><a href="#">Glyphosate, pathways to modern diseases II: Celiac sprue and gluten intoler...</a></p>
<b>Research Question/Problem/Need</b>	How does glyphosate affect celiac disease?
<b>Important Figures</b>	 <p>Graph depicting hospital discharge diagnosis (any) of celiac disease ICD-9 579 and glyphosate applications to wheat.</p>

**Table 2.** Illustration of the myriad ways in which glyphosate can be linked to celiac disease or its associated pathologies.

**(I) Alteration of gut bacteria**

Glyphosate Effect	Dysfunction	Consequences
reduced Bifidobacteria	impaired gluten breakdown	transglutaminase antibodies
reduced Lactobacillus	impaired phytase breakdown	metal chelation
anaerobic E. coli	reduced nitrospirotrans	autoimmune thyroid disease
C. diff overgrowth	indole toxicity	kidney failure
Desulfovibrio overgrowth	p-Cresol toxicity	kidney failure
	hydrogen sulfide gas	Inflammation

**(II) Transition metal utilization**

Glyphosate Effect	Dysfunction	Consequences
cobalt deficiency	cobalamin deficiency	neurodegenerative diseases
	reduced methionine	impaired protein synthesis
	elevated homocysteine	heart disease
molybdenum deficiency	inhibited sulfate oxidase	impaired sulfate supply
	inhibited xanthine oxidase	DNA damage/cancer
		osteoporosis, anemia
iron deficiency		anemia

**(III) CYP enzyme inhibition**

Glyphosate Inguirment	Dysfunction	Consequences
vitamin D3 inactivation	impaired calcium metabolism	osteoporosis, cancer risk
retinoic acid catabolism	suppressed transglutaminase	transglutinin
bile acid synthesis	impaired bile metabolism	gall bladder disease
	impaired sulfate supply	parotiditis
xenobiotic detoxification	increased toxin availability	liver disease
	impaired nitrite breakdown	microscopic anemia
		kidney failure
nitrate reductase	venous constriction	venous thrombosis

**(IV) Shikimate pathway suppression**

Glyphosate Effect	Dysfunction	Consequences
tryptophan deficiency	impaired serotonin supply	depression
	hyperactive receptors	nausea, diarrhea

Illustration of the myriad ways in which glyphosate can be linked to celiac disease or its associated pathologies.

### VOCAB: (w/definition)

Vasculature - the vascular system of a part of the body and its arrangement  
 Nephrosis - kidney disease, especially when characterized by edema and the loss of protein from the plasma into the urine due to increased glomerular permeability  
 Malignancy - the state or presence of a malignant tumor; cancer

### Cited references to follow up on

Source type	Journal article
Keywords	Diagnostic accuracy; verification bias; serology; celiac disease
#Tags	#CDTEST
Summary of key points + notes (include methodology)	A large number of studies estimating the accuracy of IgA tTG are at high risk for verification bias and that adjusting for this bias led to a substantial decrease in the sensitivity estimate. Continued use of IgA tTG as an initial diagnostic test may lead to underdiagnosis of CD. <a href="#">Estimating the Impact of Verification Bias on Celiac Disease Testing [notes]</a>
Research Question/Problem/Need	What is the impact of verification bias on the diagnostic accuracy of immunoglobulin A tissue transglutaminase (IgA tTG) in detecting celiac disease?
Important Figures	

Figure 1: referral rates to upper endoscopy and duodenal biopsy after an abnormal IgA tissue transglutaminase antibody test from the 9 studies identified in the systematic review, as well as a pooled referral rate.

Figure 2: referral rates to upper endoscopy and duodenal biopsy after a normal IgA tissue transglutaminase antibody test from the 9 studies identified in the systematic review, as well as a pooled referral rate.

**VOCAB: (w/definition)**

Kappa statistic - The kappa statistic compares observed accuracy with expected accuracy (random chance)  
 Begg and Greenes method - uses observed proportions of those who have and do not have the target condition among the verified participants to calculate the expected number of those who have and do not have the target condition among those participants who did not undergo condition verification

<b>Follow up Questions</b>	<p>Is it possible to do this using a software program instead of all in vitro?          What other methods are there for analyzing the data?</p>

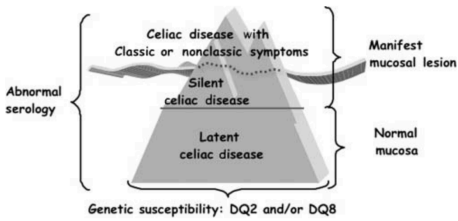

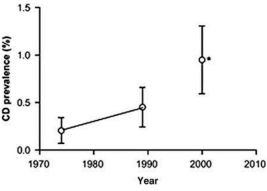

## Article #19 Notes: Celiac disease: pathogenesis of a model immunogenetic disease

<b>Source Title</b>	The Journal of Clinical Investigation
<b>Source citation (APA Format)</b>	Kagnoff, M. F. (2007). Celiac disease: pathogenesis of a model immunogenetic disease. <i>Journal of Clinical Investigation</i> , 117(1), 41–49. <a href="https://doi.org/10.1172/jci30253">https://doi.org/10.1172/jci30253</a>
<b>Original URL</b>	<a href="https://www.jci.org/articles/view/30253">https://www.jci.org/articles/view/30253</a>
<b>Source type</b>	Journal article
<b>Keywords</b>	celiac disease, enteropathy-associated T cell lymphoma, “gluten”-free diet, intraepithelial lymphocyte
<b>#Tags</b>	#INTRODUCTION
<b>Summary of key points + notes (include methodology)</b>	It is essential to develop animal models to model the key events in the pathogenesis of this disease. Discovery and understanding of the missing links in this process can lead to new approaches for the prevention, diagnosis, and treatment of CeD. <a href="#">Celiac disease: pathogenesis of a model immunogenetic disease [notes]</a>
<b>Research Question/Problem/Need</b>	What is the role of adaptive and innate immune mechanisms in the pathogenesis of CeD?
<b>Important Figures</b>	<p>Pathogenesis of CD. This schematic divides the pathogenesis of CD into 3 major series of events: luminal and early mucosal events; the activation of pathogenic CD4+ T cells; and the subsequent events leading to tissue damage.</p>
<b>VOCAB: (w/definition)</b>	Squamoid - scaly

	<p>Crypt hypertrophy - when the grooves are elongated compared to a normal intestinal lining which has short crypts</p> <p>Hexaploid genome - six copies of each chromosome</p>
<b>Cited references to follow up on</b>	<p>Khosla, C., Gray, G.M., and Sollid, L.M. 2005. Putative efficacy and dosage of prolyl endopeptidase for digesting and detoxifying gliadin peptides. <i>Gastroenterology</i>. 129:1362–1363; author reply 1363.</p> <p>Mention, J.J., et al. 2003. Interleukin 15: a key to disrupted intraepithelial lymphocyte homeostasis and lymphomagenesis in celiac disease. <i>Gastroenterology</i>. 125:730–745.</p> <p>Johansen, B.H., et al. 1996. Both alpha and beta chain polymorphisms determine the specificity of the disease-associated HLA-DQ2 molecules, with beta chain residues being most influential. <i>Immunogenetics</i>. 45:142–150.</p>
<b>Follow up Questions</b>	<p>Are there any other potential therapeutics for CeD?</p> <p>What other important peptides to inhibit CeD are there?</p> <p>Why does barley and rye have less of an impact on CeD pathology?</p>

## Article #20 Notes: New Clues in Celiac Disease Epidemiology, Pathogenesis, Clinical Manifestations, and Treatment

<b>Source Title</b>	International Reviews of Immunology
<b>Source citation (APA Format)</b>	Lionetti, E. & Catassi, C. New Clues in Celiac Disease Epidemiology, Pathogenesis, Clinical Manifestations, and Treatment. (2011). <i>International Reviews of Immunology</i> . Vol. 30, Issue 4. <a href="https://www.tandfonline.com/doi/full/10.3109/08830185.2011.602443">https://www.tandfonline.com/doi/full/10.3109/08830185.2011.602443</a>
<b>Original URL</b>	<a href="https://www.tandfonline.com/doi/full/10.3109/08830185.2011.602443">https://www.tandfonline.com/doi/full/10.3109/08830185.2011.602443</a>
<b>Source type</b>	Journal article
<b>Keywords</b>	celiac disease, epidemiology, pathogenesis, clinical manifestations, therapy
<b>#Tags</b>	#INTRODUCTION
<b>Summary of key points + notes (include methodology)</b>	CeD is the result of an abnormal immune reaction, the clinical spectrum of which is large, including cases with either typical intestinal or atypical extraintestinal features as well as silent forms. New pharmacological treatments are few and far between and are under heavy clinical testing. <a href="#">New Clues in Celiac Disease Epidemiology, Pathogenesis, Clinical Manifestati...</a>
<b>Research Question/Problem/Need</b>	n/a (review of topics)
<b>Important Figures</b>	 <p>The diagram illustrates the iceberg model of Celiac Disease (CeD). It features a large inverted triangle representing the population of affected individuals. The top, narrow tip of the triangle is labeled 'Celiac disease with Classic or nonclassic symptoms' and is associated with 'Manifest mucosal lesion'. The middle section is labeled 'Silent celiac disease' and is associated with 'Normal mucosa'. The bottom, wide base of the triangle is labeled 'Latent celiac disease' and is also associated with 'Normal mucosa'. A bracket on the left side of the triangle is labeled 'Abnormal serology', indicating that all three forms (symptomatic, silent, and latent) have abnormal serology. A bracket at the bottom of the triangle is labeled 'Genetic susceptibility: DQ2 and/or DQ8', indicating that all three forms share this genetic susceptibility. Below the diagram, the text reads: 'Iceberg model of CeD (above) and prevalence of CeD over multiple decades (below)'.</p> <p>Iceberg model of CeD (above) and prevalence of CeD over multiple decades (below)</p>

	 <p>The graph illustrates the increasing prevalence of Celiac Disease (CD) over time. The y-axis represents CD prevalence in percent, ranging from 0.0 to 1.5. The x-axis represents the year, ranging from 1970 to 2010. Three data points are plotted: approximately 0.2% in 1970, 0.5% in 1990, and 1.0% in 2000. Each point includes vertical error bars indicating variability.</p>
<b>VOCAB: (w/definition)</b>	<p>Heterodimers - a protein composed of two polypeptide chains differing in composition in the order, number, or kind of their amino acid residues</p> <p>Hypotonia - decreased muscle tone</p>
<b>Cited references to follow up on</b>	<p>Mustalahti K, Catassi C, Reunanen A, et al. The prevalence of CD in Europe: results of a centralized, international mass screening project. <i>Ann Med.</i> 2010;42:587–595.</p> <p>Bach JF. The effect of infections on susceptibility to autoimmune and allergic diseases. <i>N Engl J Med.</i> 2002;347:911–920.</p> <p>Jabri B, Sollid LM. Tissue-mediated control of immunopathology in coeliac disease. <i>Nat Rev Immunol.</i> 2009;9:858–870.</p>
<b>Follow up Questions</b>	<p>Is the increased % of people with CeD a result of the disease becoming more prevalent or a greater improvement in testing accuracy?</p> <p>Why is CeD rising in developed countries more commonly than undeveloped countries?</p> <p>How can zonulin be modified to lessen the risk of gluten proteins entering the small intestine?</p> <p>Can other diseases in early childhood effect prevalence of CeD later in life (microbiome)?</p>

## Patent #1 Notes: Methods of Treating Celiac Disease Using SMAD7 Inhibition

<b>Source Title</b>	Google Patents
<b>Source citation (APA Format)</b>	Monteleone, G. (2021). <i>Methods of Treating Celiac Disease Using SMAD7 Inhibition</i> (U.S. Patent No. 20210207143). U.S. Patent and Trademark Office. <a href="https://patents.google.com/patent/US20210207143A1/en">https://patents.google.com/patent/US20210207143A1/en</a>

<b>Keywords</b>	Inhibitor, CeD, treatment, oligonucleotide, growth factor signaling, villous atrophy
<b>#Tags</b>	#INTRODUCTION #CDTREATMENT
<b>Summary of key points + notes</b>	<p>The invention consists of techniques for controlling the administration of the SMAD7 antisense oligonucleotide therapy for celiac disease, as well as ways to measure its efficacy based on examination of Transforming Growth Factor-<math>\beta</math> (TGF-<math>\beta</math>) signaling activity.</p> <p> <a href="#">Methods of Treating Celiac Disease Using SMAD7 Inhibition [notes]</a></p>
<b>VOCAB: (w/definition)</b>	<p>Growth factor - naturally occurring substance that can stimulate cell growth, wound healing, and tissue repair</p> <p>Oligonucleotide - short, single- or double-stranded DNA or RNA molecules</p> <p>Antisense - a non-coding DNA strand of a gene, used as a template for mRNA</p> <p>Clinical amelioration - relating to the direct medical treatment or testing of patients</p> <p>Enteric coating - polymer barrier applied to oral medication that prevents its dissolution or disintegration in the gastric environment</p>
<b>Follow up Questions</b>	<p>Was there any data analysis done? What methods were used?</p> <p>What is the relationship between SMAD7 and HLA?</p> <p>Does the inhibitor affect any other systems in the digestive tract or immune system?</p>

## Patent #2 Notes: Treatment of celiac disease

<b>Source Title</b>	Google Patents
<b>Source citation (APA Format)</b>	Bonnafous, C., Sicard, H., Buffet, R., Hermine, O. (2016). <i>Title of patent</i> (Fr. Patent No. 2016030488). Institut national de la propriété industrielle. <a href="https://patents.google.com/patent/WO2016030488A1/en">https://patents.google.com/patent/WO2016030488A1/en</a>
<b>URL</b>	<a href="https://patents.google.com/patent/WO2016030488A1/en?q=(celiac+disease+treatment)&amp;oq=celiac+disease+treatment">https://patents.google.com/patent/WO2016030488A1/en?q=(celiac+disease+treatment)&amp;oq=celiac+disease+treatment</a>
<b>Keywords</b>	Inhibition, antibody, peptide, HLA, cell proliferation
<b>#Tags</b>	#INTRODUCTION #CDTREATMENT
<b>Summary of key points + notes</b>	<p>It has been shown that KIR3DL2-positive persons can also have celiac disease. Treatment options for KIR3DL2-negative patients include employing an antigen binding agent that binds to a KIR3DL2 polypeptide to treat or prevent celiac disease in a single person.</p> <p> Treatment of celiac disease [notes]</p>
<b>VOCAB: (w/definition)</b>	<p>IEL - lymphocytes associated with the intestinal tract, respiratory tract, genitourinary tract epithelium, and the skin and are the first immune system cells to encounter pathogens that have invaded an epithelial surface</p> <p>Polyclonal - produced by, involving, or being cells derived from two or more cells of different ancestry or genetic constitution</p> <p>Ex vivo - takes place outside an organism</p> <p>Moiety - a specific group of atoms within a molecule that is responsible for characteristic chemical reactions of that molecule</p>
<b>Follow up Questions</b>	<p>Does KIR3DL2 interact with HLA-DQ2?</p> <p>Does tTG modification affect KIR3DL2 interaction with its peptides?</p> <p>What is LQYDELPYT (peptide sequence) derived from?</p>

## Patent #3 Notes: Peptide microarrays and novel biomarkers for celiac disease

<b>Source Title</b>	Google Patents
<b>Source citation (APA Format)</b>	Bei, K., Jayaraman, K., Krishna, K., Krishnamurthy, K., Rajasekaran, J., Wang, T. (2015). <i>Peptide microarrays and novel biomarkers for celiac disease</i> (Au. Patent No. 2019200921). IP Australia. <a href="https://patents.google.com/patent/AU2019200921B2/en">https://patents.google.com/patent/AU2019200921B2/en</a>
<b>URL</b>	<a href="https://patents.google.com/patent/AU2019200921B2/en?q=(celiac+disease+treatment)&amp;oq=celiac+disease+treatment">https://patents.google.com/patent/AU2019200921B2/en?q=(celiac+disease+treatment)&amp;oq=celiac+disease+treatment</a>
<b>Keywords</b>	Automated robotics, chemoselectivity, antigens, peptides, inhibition
<b>#Tags</b>	#INTRODUCTION #CDTREATMENT
<b>Summary of key points + notes</b>	<p>The invention is broadly related to peptide arrays and biomarkers, and specifically to a technique of identifying biomarkers for autoimmune diseases such as celiac disease utilizing a peptide array. A collection of highly sensitive and specific novel biomarkers for celiac disease are revealed, along with treatment strategies based on the novel biomarkers.</p> <p> Peptide microarrays and novel biomarkers for celiac disease [notes]</p>
<b>VOCAB: (w/definition)</b>	<p>Chemoselectivity - the tendency for a specific reaction pathway to occur among a set of potential alternatives in chemical reactions</p> <p>Endogenous antigens - antigens that exist on cells inside your body</p> <p>Th1 and Th2 cells - Th1 cells mainly develop following infections by intracellular bacteria and some viruses, whereas Th2 cells predominate in response to infestations by gastrointestinal nematodes</p> <p>Heat maps - 2-dimensional data visualization technique that represents the magnitude of individual values within a dataset as a color</p> <p>Linker molecule - cleavable or noncleavable molecules that connect a functional (bio)molecule with a molecular tag to form a conjugate</p>
<b>Follow up Questions</b>	<p>Why is the specific peptide length 12 amino acids long?</p> <p>Can these biomarkers be applied to other antigens or diseases with similar pathology?</p>
