<b>Summary of key points + notes (include methodology)</b>	Eyes are typically considered good candidates for gene therapy, since they are small and therefore do not require high doses of treatment, have separate and distinct parts, and they are extremely likely to accept treatment via viruses due to certain features of their immune system. Different ways of administering this therapy include viral methods and chemical methods. Both methods can cause inflammatory response
<b>Research Question/Problem/Need</b>	How can inflammation caused by administration of ocular gene therapy be managed after treatment?
<b>Important Figures</b>

<b>Source type</b>	Journal Article
<b>Keywords</b>	aberrations, astigmatism, cornea, corneal topography, refractive error
<b>#Tags</b>	#astigmatism #environmentalcauses #stats #idea1
<b>Summary of key points + notes (include methodology)</b>	While there is no known cause of astigmatism, there are theories concerning the genetics that cause astigmatism and environmental conditions that may also affect a person with the condition. This article heavily implies that environmental conditions are more likely to cause astigmatism than genes. However, astigmatism is also supposed to be linked to myopia, implying that there is a genetic factor involved in this condition too.
<b>Research Question/Problem/Need</b>	What are some environmental/genetic factors that may cause astigmatism?

**Important  
Figures**

**Figure 4.** Axial curvature corneal topographical maps from the right and left eye of a subject who shows distinct mirror symmetry between the corneal astigmatism of the two eyes

**Figure 6.** Illustration of the eyelid pressure theory of corneal astigmatism development. According to this theory, pressure from the eyelids alters corneal shape and leads to a steepening in the cornea's vertical meridian. This results in WTR astigmatism, which is typically seen in the majority of young subjects.

<b>VOCAB:</b> (w/definition)	Astigmatism-condition where a person has an oddly shaped cornea, which leads to light hitting abnormally entering the retina Cornea- the translucent layer of the eye that covers/protects the retina
<b>Cited references to follow up on</b>	*to be inserted at a later date*
<b>Follow up Questions</b>	What does a person with astigmatism's genome look like compared to a person without the condition? What gene/s cause myopia? What causes astigmatism? Are there certain genetic factors that cause a person to be more susceptible to sustaining damage to their cornea? What does the genome of a person with myopia look like compared to a person with myopia and astigmatism? How can we analyze a person's genome to find out what causes this condition? Are there multiple types of genetic astigmatism?

## Article #3 Notes: The Effect of Music and Suggestion on Defensive Driving Responses of High School Students: Implications for Music Therapy

Article notes should be on separate sheets

<b>Source Title</b>	The Effect of Music and Suggestion on Defensive Driving Responses of High School Students: Implications for Music Therapy – Oxford Academic
<b>Source citation (APA Format)</b>	Groene, R., & Barrett, S. (2012). <b>Source type</b>	Journal Article
<b>Keywords</b>	Aggressive driving, music therapy,
<b>#Tags</b>	#aggressivedriving #musictherapy #roadrage #drivereducation #suggestions #musicchoices
<b>Summary of key points + notes (include methodology)</b>	In this study, researchers were trying to determine if music therapist-composed music has an effect on adolescent stress levels while driving. Participants completed two driving sessions-one in silence, and the other with music accompanied by suggestions to deter aggressive driving behaviors. In the study, 83.33% of participants felt less stress during the music/suggestion condition.
<b>Research Question/Problem/Need</b>	What types of music help to lower stress levels while driving, thus deterring aggressive driving behaviors?

## Important Figures

## Driving Simulator Scores: All Mus/Sugg vs Silence

This graph represents the mean score drivers received for correct defensive maneuvers during each treatment. As seen, the mean driving score was higher during the music/suggestion condition, and the p-value for obtaining these results was less than .001.

### Student Opinion of Driving Stress

Stress During Music & Driving Reminders vs Silence

L = Less M = More S = The Same

In this graph, it can be seen that 83.33% of participants felt less stress during the music/suggestion treatment, 11.11% felt more stressed during the music/suggestion treatment, and 5.56% felt the same amount of stress during both treatments.

**VOCAB: (w/definition)**

Aggressive driving-people commit a series of traffic offenses to endanger other drivers; Road rage: An incident instigated using a motor vehicle against another/an act that occurred between two motor vehicles as a result of an event that occurred while driving

<b>Source type</b>	Journal Article
<b>Keywords</b>	Simulated driving, vehicular music, music tempo, driving performance, control, speed, estimates
<b>#Tags</b>	#background #simulation #method
<b>Summary of key points + notes (include methodology)</b>	Not many experiments have been conducted in the past that indicate a link between music and its effects on driving. In this article, two different studies were performed. In the first study, musicians were tasked to drive around a virtual “loop” of Chicago. Different music with different tempos were played at different points in the loop. Data was then put into an ANOVA test (Heart rate, heart rate fluctuations, red light violations, etc.) However, no statistically significant data were found. However, the second experiment was conducted with non-musicians, and data such as increases in simulated driving speed, heart rate fluctuations (with no music), etc. However, researchers acknowledged that they used a simulation to conduct their research which could influence the outcome.
<b>Research Question/Problem/Need</b>	Does the tempo of music affect certain factors of someone’s driving?

<b>Source type</b>	Journal Article
<b>Keywords</b>	Emotion, Emotional valence, Attention processes, Driving, Music
<b>#Tags</b>	#background #drivingsafety #method
<b>Summary of key points + notes (include methodology)</b>	In this study, researchers tested whether different types of music affect driving performance. To do this they have participants listen to music in a driving simulation for 5 minutes, drive without music for a few minutes and then listen to a differently connotated music. This was done with happy music, then neutral music, then sad music. The results showed an association between the car speeding up & have having less control over driving near the line with happy music. They also found that drivers tended to driver closer to the line and with safer speeds when listening to sad music. However, these results should be generalized with caution, since the study was only tested with French people, and the sample size was only 17 people.
<b>Research Question/Problem/Need</b>	How does listening to music with different connotations affect an individual's performance driving a car?

<p><b>Important Figures</b></p>	 <p><b>Fig. 2.</b> Mean Speed in km/h as a function of the emotional valence of music (happy, sad and neutral) and the phase (Driving with Music and Driving Alone phases).</p> <table border="1" data-bbox="565 226 1458 989"> <caption>Data extracted from Fig. 2</caption> <thead> <tr> <th>Valence</th> <th>Driving with Music Phase (km/h)</th> <th>Driving Alone Phase (km/h)</th> </tr> </thead> <tbody> <tr> <td>Happy</td> <td>~87</td> <td>~98</td> </tr> <tr> <td>Sad</td> <td>~98</td> <td>~101</td> </tr> <tr> <td>Neutral</td> <td>~100</td> <td>~99</td> </tr> </tbody> </table>	Valence	Driving with Music Phase (km/h)	Driving Alone Phase (km/h)	Happy	~87	~98	Sad	~98	~101	Neutral	~100	~99

<b>Keywords</b>	Tempo, Emotion, Music, Skin conductance, Heart rate, Respiration rate, Diastolic blood pressure, Zygomatic activity
<b>#Tags</b>	#background #otherimportantfacts #wodriving
<b>Summary of key points + notes (include methodology)</b>	In this experiment, researchers were trying to see if the tempo or rhythm of a song determines whether a song is happy or sad. To test this, they had people listen to 3 happy songs, then 3 sad songs, then 3 happy, and then 3 sad. Participants were asked to rate the valence and arousal level of the song. The researchers also monitored blood pressure, skin conductance, and respiration rates during the experiment. However, many of their results turned back inconclusive results individually, and conclusive results when combined.
<b>Research Question/Problem/Need</b>	Does the tempo/rhythm of a song distinguish it as happy or sad?

## Important Figures

Fig. 1. Means and standard errors of the percentage of emotion recognition according to each stimuli categories. Black filled circles represents fast tempo stimuli and white filled circles represents slow tempo stimuli.

Fig. 2. Bi-dimensional representation of means and standard errors bars of t arousal and valence assessment of the stimuli.

Table 1

Means (SD) changes in RMS values of the zygomatic and corrugator muscles from the pre-stimulus baseline during the 60-s of all stimuli categories listening

Mean RMS ( $\pm$ SD)	Conditions	60 s	Mean RMS ( $\pm$ SD)	Conditions	60 s
Zygomatic ( $10^{-1}$ )	Sad	-0.43 ( $\pm$ 1.52)	Corrugator ( $10^{-4}$ )	Sad	6.25 ( $\pm$ 7.82)
	Happy	1.13 ( $\pm$ 3.00)		Happy	4.19 ( $\pm$ 4.02)
	Sad R	-0.27 ( $\pm$ 3.55)		Sad R	5.87 ( $\pm$ 4.44)
	Happy R	-0.54 ( $\pm$ 2.73)		Happy R	4.55 ( $\pm$ 5.86)
	Sad T	0.59 ( $\pm$ 3.68)		Sad T	3.56 ( $\pm$ 10.62)
	Happy T	-0.10 ( $\pm$ 3.24)		Happy T	2.80 ( $\pm$ 14.08)

Changes of facial muscles activity.

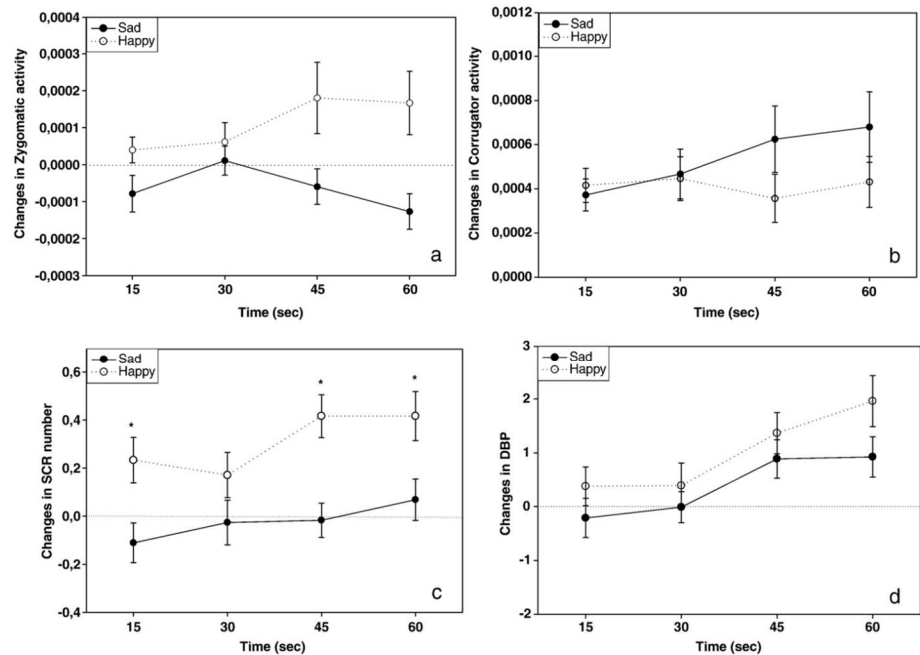

Fig. 3. Means (and standard errors) changes in zygomatic activity (a), corrugator activity (b), skin conductance responses (c), diastolic blood pressure (d) from the pre-stimulus baseline ( $\gamma=0$ ) during successive 15-s epochs of happy and sad excerpts. \* indicates statistically significant differences ( $p < .05$ ).

**VOCAB: (w/definition)**

Zygomatic activity: facial activity Mode: subset of pitches used to write a song  
 Tempo: BPM of a song rhythm: temporal patterning conveyed by tones' perception

<b>Keywords</b>	mood, cognition, mood induction, memory																
<b>#Tags</b>	#focus #mysteries #cognition																
<b>Summary of key points + notes (include methodology)</b>	The affect of mood on memory is widely unknown, so the purpose of this study was to try and solve this mystery. In the experiment, all participants participated in two different pieces. First, participants were asked to imagine the death of a loved one while listening to sad music, and then completing a series of tasks. In another session, participants were tasked with doing the same thing but with listening to neutral music before. Tasks completed included matching shapes to a previous picture, reciting the color of a word displayed on the screen, reacting to something on a computer, among other tests. Sad mood was found to have a statistically significant effect on the recognition tasks.																
<b>Research Question/Problem/Need</b>	What affect does a sad mood have on memory compared to a neutral mood?

<b>Original URL</b>	<a href="https://pubmed.ncbi.nlm.nih.gov/10467897/">https://pubmed.ncbi.nlm.nih.gov/10467897/</a>
<b>Source type</b>	Journal Article
<b>Keywords</b>	Dopamine, cognition, positive effects
<b>#Tags</b>	#background #positiveeffects #cognition
<b>Summary of key points + notes (include methodology)</b>	While more of a research paper than a study, this paper seeks to come up with a theory for the effects a positive attitude has on cognition. Overall, positive mood causes an individual to think outside of the box and see solutions to situations that they may have not previously seen. In lab settings, an increase in mood has also been shown to have positive results in patients with Parkinson's disease.
<b>Research Question/Problem/Need</b>	What are the effects of positive mood on cognition?
<b>Important Figures</b>	
<b>VOCAB: (w/definition)</b>	Dopamine: a neurotransmitter in the brain, has an effect on mood, memory, motor function, etc; Parkinson's Disease: progressive death of dopamine cells in the brain; Amygdala: area of the brain involved in processing emotions
<b>Cited references to follow up on</b>	Cahill, L., Babinsky, R., Markowitsch, H. J., & McGaugh, J. L. (1995). The amygdala and emotional memory. <i>Nature</i> , 377, 295-296. Gaffan, D. (1992). Amygdala and the memory of reward. In J. P. Aggleton (Ed.), <i>The amygdala</i> (pp. 471-483). New York: Wiley Hale, W. D., & Strickland, B. (1976). Induction of mood states and their effect on cognitive and social behaviors. <i>Journal of Consulting and Clinical Psychology</i> , 44, 155
<b>Follow up Questions</b>	Does the brain register music like a drug? Does a good mood make you less likely to get distracted while driving? What causes different emotions in a person?

# Article #10 Notes: Measuring Brain Waves in the Classroom

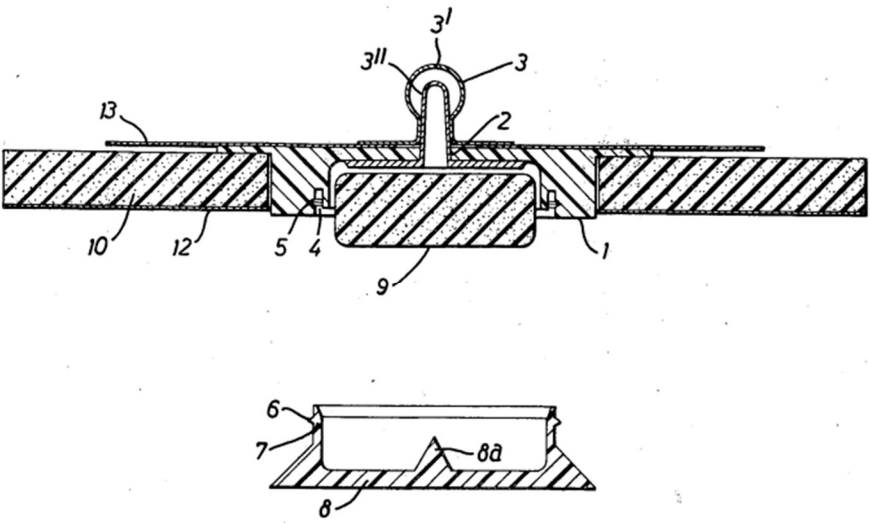

Article notes should be on separate sheets

<b>Source Title</b>	Measuring Brain Waves in the Classroom
<b>Source citation (APA Format)</b>	van Atteveldt, N., Janssen, T. W. P., & Davidesco, I. <b>Source type</b>	Website Article
<b>Keywords</b>	Brain waves, electroencephalography, electrodes,
<b>#Tags</b>	#devices #reader #brain #brainwaves
<b>Summary of key points + notes (include methodology)</b>	First, this article explained what an electroencephalogram was - a device used to measure brain waves. This device uses electrodes to measure brain activity, which are detectors placed on a person's scalp. It is also mentioned that a test such as a go/no-go test can be used to decode how specific reactions appear in an electroencephalography test. Finally, it was mentioned that a test was conducted with teachers and students in an actual classroom, and it was found that the students who were more engaged tended to have synchronized brain waves
<b>Research Question/Problem/Need</b>	What does the brain activity of students look like in a classroom?

<p><b>Important Figures</b></p>	<div data-bbox="548 226 1490 758" style="border: 2px solid green; padding: 10px;"> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 15%;">Frequency band</th> <th style="width: 15%;">Speed (Hz)</th> <th style="width: 15%;">Mental state</th> <th style="width: 55%;">Electroencephalography (EEG) recording</th> </tr> </thead> <tbody> <tr> <td>Delta</td> <td>1-4</td> <td>Deep sleep</td> <td></td> </tr> <tr> <td>Theta</td> <td>4-8</td> <td>Drowsy</td> <td></td> </tr> <tr> <td>Alpha</td> <td>8-12</td> <td>Relaxed</td> <td></td> </tr> <tr> <td>Beta</td> <td>12-30</td> <td>Focused</td> <td></td> </tr> </tbody> </table> <p style="text-align: right; margin-right: 10px;">Slow ↓ Fast</p> <p style="text-align: center; margin-top: 5px;">1 second</p> </div> <p style="font-size: small; margin-top: 10px;">Figure 1 - EEG frequency bands from slow to fast and how they relate to mental state. <p><b>Follow up Questions</b></p>	<p>What do brain waves look like when someone is feeling different emotions? Why are brain waves slower the more relaxed you are? What is the most common brain wave frequency in humans? Can this predict the emotion that most people feel on a daily basis?</p>																				

# Patent #1 Notes: Electrodes

Article notes should be on separate sheets

<b>Source Title</b>	Electrodes
<b>Source citation (APA Format)</b>	Bowles, L. R., Heath-Coleman, R. A. (1976). <i>Electrodes</i> (U.S. Patent No. 3,942,517). U.S. Patent and Trademark Office. <a href="https://patentimages.storage.googleapis.com/20/48/f7/87fb2d666c5f3b/US3942517.pdf">https://patentimages.storage.googleapis.com/20/48/f7/87fb2d666c5f3b/US3942517.pdf</a>
<b>Original URL</b>	<a href="https://patents.google.com/patent/US3942517A/en">https://patents.google.com/patent/US3942517A/en</a>
<b>Source type</b>	Patent
<b>Keywords</b>	Gel container, plastic, gel, sterility, hermetic seal
<b>#Tags</b>	#devices #method #patents
<b>Summary of key points + notes (include methodology)</b>	This patent introduced a improved electrode design in which the gel containers of the electrode that attach to the skin are automatically sealed when the capsule is removed. This aides in the caps having a longer shelf-life by preventing the gel from dehydrating.
<b>Research Question/Problem/Need</b>	How can the design of gel containers in electrodes be made to last longer?
<b>Important Figures</b>	 <p>The figure consists of two technical drawings of an electrode. The upper drawing is a top view showing a central cylindrical component (9) with a ring-like structure (3) on top. The ring has a central opening (3') and a side opening (3''). The electrode is attached to a substrate (1) via a base (10) and a seal (12). Other components labeled include 13, 5, 4, and 1. The lower drawing is a side view showing a cross-section of the electrode. It features a top layer (6), a side layer (7), and a central cavity (8a) within a base (8).</p>
<b>VOCAB: (w/definition)</b>	Hermetic seal- an airtight seal; shelf-life: amount of time an object can safely be

	deemed as usable or sellable; corrosion: chemical wear-down of a substance over time;
<b>Cited references to follow up on</b>	
<b>Follow up Questions</b>	How do electrodes collect information about electrical signals in the brain? What brain waves are the most easily detectable using electrodes? Are there any other devices used to collect information about brain waves?

## Patent #2 Notes: Device and method for performing electroencephalography

Article notes should be on separate sheets

<b>Source Title</b>	Device and method for performing electroencephalography
<b>Source citation (APA Format)</b>	Mcpeck, J. P., Principe, K. M. (2008). <i>Device and method for performing electroencephalography</i> (European Patent No. 08847101.6). <b>Source type</b>	Journal Article
<b>Keywords</b>	auditory stimuli; deflection; responsiveness; road safety
<b>#Tags</b>	#previousdata #background #data
<b>Summary of key points + notes (include methodology)</b>	In this study, participants were split into three groups and completed tests on a computer while listening to different audio distractions. At the end, participants were asked to fill out a questionnaire about the experiment overall. No significant results were found by the experiment.
<b>Research Question/Problem/Need</b>	How do different auditory stimuli affect one's performance while driving?
<b>Important Figures</b>	Due to the fact that the data found was NOT significant, figures will not be included.
<b>VOCAB: (w/definition)</b>	OSPAN – Operation span – sum of sets a participant remembers perfectly
<b>Cited references to follow up on</b>	Atchley, P.; Chan, M. Potential Benefits and Costs of Concurrent Task Engagement to Maintain Vigilance: A Driving Simulator Investigation <i>Human Factors</i> . J. Hum. Factors Ergon. Soc. 2011, 53, 3–12. <b>#Tags</b>	#previousdata #distractions #variables																				
<b>Summary of key points + notes (include methodology)</b>	In this study, researchers were trying to determine if having a conversation at a specific point while driving was effective in keeping the driver focused. They did this by simulating a relatively boring drive, and testing three conditions: no conversation while driving, conversation being had throughout the whole drive, and having a conversation solely later in the drive. Overall, it was found that conversing throughout the whole drive is not effective in keeping the driver focused, but conversing later in the drive is effective in helping the driver keep focus on the road.																				
<b>Research Question/Problem/Need</b>	How does having a conversation while driving help the driver keep focused during a boring drive?																				
<b>Important Figures</b>	<p><b>TABLE 3:</b> Total Number of Steering Deflections &gt;10°, as a Function of Time</p> <table border="1"> <thead> <tr> <th>Condition</th> <th>Block 2</th> <th>Block 3</th> <th>Block 5</th> </tr> </thead> <tbody> <tr> <td colspan="4">Steering angles &gt;10°</td> </tr> <tr> <td>No verbal task</td> <td>2.07 (1.83)</td> <td>3.47 (2.59)</td> <td>5.80 (5.05)</td> </tr> <tr> <td>Continuous verbal task</td> <td>1.27 (1.33)</td> <td>2.27 (1.44)</td> <td>3.60 (1.44)</td> </tr> <tr> <td>Late verbal task</td> <td>1.67 (2.55)</td> <td>3.80 (3.19)</td> <td>2.27 (1.22)</td> </tr> </tbody> </table> <p>Note. Duration of lane infractions			
No verbal task	1,039.69 (818.66)	1,466.82 (1324.49)	2,241.36 (1406.76)
Continuous verbal task	1,134.78 (1128.66)	1,697.17 (1703.89)	3,210.81 (1801.78)
Late verbal task	1,323.56 (1506.33)	1,894.95 (1446.86)	3,025.57 (2335.15)

Note. Each time block is approximately 5 min in duration. Standard deviations are shown in parentheses.

**TABLE 1:** Deviation of Lane Position (in meters) and Deviation of Steering Wheel Angle (in degrees) as a Function of Time

Condition	Block 2	Block 3	Block 5
Deviation of lane position			
No verbal task	0.39 (0.19)	0.42 (0.19)	0.45 (0.18)
Continuous verbal task	0.36 (0.22)	0.38 (0.23)	0.43 (0.23)
Late verbal task	0.40 (0.27)	0.42 (0.26)	0.35 (0.20)
Deviation of steering wheel angle			
No verbal task	2.11 (0.52)	2.51 (0.59)	2.96 (1.33)
Continuous verbal task	1.84 (0.37)	2.33 (0.33)	2.51 (0.74)
Late verbal task	1.98 (0.49)	2.49 (0.62)	2.09 (0.46)

Note. Each time block is approximately 5 min in duration. Standard deviations are shown in parentheses.

**VOCAB: (w/definition)**

Concurrent task – a task that occurs at the same time as another, but both aren’t performed simultaneously  
 Interstimulus interval – The amount of time between which stimulus words were delivered to the participant  
 SDLP – standard deviation of lane position  
 SSD – steering wheel angle  
 RT – driver response to intruder car

**Cited references to follow up on**

 Gershon P., Ronen A., Oron-Gilad T., Shinar D. (2009). The effects of an interactive cognitive task (ICT) in suppressing fatigue symptoms in driving. *Transportation Research Part F*, 12, 21–28.  
 Howell D. C. (2002). *Statistical methods for psychology* (5th ed.). Pacific Grove, CA: Wadsworth.

**Follow up Questions**

Could other concurrent tasks have a different effect on the driver while driving? What if the driver was driving on a less monotonous road, could this produce different results? If the interstimulus interval were larger, could this have produced different results as well?

## Article #15 Notes: The Effect of Road Traffic Noise on Reaction Time

<b>Source Title</b>	The Effect of Road Traffic Noise on Reaction Time

<b>#Tags</b>	#data #compiled #databases
<b>Summary of key points + notes (include methodology)</b>	In this study, multiple different databases were searched for information about studying listening to music while driving. It was found that Americans listen to music about 75% of the time they are behind the steering wheel. It was also found that the most common music style listened to was rock, and that music with a medium and faster volume increases driving speed, and music with a lower volume decreases average speed of the car. It was also found that all music reduced reaction time, reduces response time, and increases coherence.
<b>Research Question/Problem/Need</b>	Many studies pertaining to listening to music while driving produce confound results, this study aims to condense these results.

<b>Summary of key points + notes (include methodology)</b>	This article explores what makes teens drivers more likely to get into a car crash than adult drivers, as well as differentiates what causes an emerging adult (18–25-year-old) vs an adolescent (16/17 year old) to take risks while driving. For 18-25 year olds, being away from home and not living at home means no imposed restrictions, which may lead an emerging adult to take more risks. For a 16/17-year-old, driving with friends is relatively common, and this can lead to a driver getting more distracted and getting into a crash. It was also mentioned that males are more likely to take risks in traffic than females.																				
<b>Research Question/Problem/Need</b>	What causes adolescent and emerging adult drivers to take risks in traffic?																				
<b>Important Figures</b>	<p><b>Table 1</b> Rates of risky vehicle use by Danish and American adolescents</p> <table border="1"> <thead> <tr> <th rowspan="2">Behavior</th> <th colspan="2">At least once in past year (%)</th> </tr> <tr> <th>Danish</th> <th>American</th> </tr> </thead> <tbody> <tr> <td>Driving car &gt;80 MPH</td> <td>20</td> <td>79</td> </tr> <tr> <td>Driving car &gt;20 MPH over speed limit</td> <td>22</td> <td>85</td> </tr> <tr> <td>Driving car while intoxicated</td> <td>7</td> <td>26</td> </tr> <tr> <td>Riding moped while intoxicated</td> <td>20</td> <td>0</td> </tr> <tr> <td>Riding bicycle while intoxicated</td> <td>78</td> <td>3</td> </tr> </tbody> </table> <p>MPH, miles per hour. For the first two items, MPH were converted to kilometers for the Danish adolescents. Danish adolescents, n = 100 (45 boys, 55 girls); American adolescents, n = 133 (63 boys, 70 girls).</p>	Behavior	At least once in past year (%)		Danish	American	Driving car >80 MPH	20	79	Driving car >20 MPH over speed limit	22	85	Driving car while intoxicated	7	26	Riding moped while intoxicated	20	0	Riding bicycle while intoxicated	78	3
Behavior	At least once in past year (%)																				
	Danish	American																			
Driving car >80 MPH	20	79																			
Driving car >20 MPH over speed limit	22	85																			
Driving car while intoxicated	7	26																			
Riding moped while intoxicated	20	0																			
Riding bicycle while intoxicated	78	3
