## **Project Title: Hydrothermal Liquefaction Utilizing Styrene Monomers Coupled with Hydrogen Peroxide**

**Name:** McKenna Childs

**Note Well:** There are NO SHORT-cuts to reading journal articles and taking notes from them. Comprehension is paramount. You will most likely need to read it several times so set aside enough time in your schedule.

Google Scholar	Waste to fuel technologies	Articles #9

## Article #1 Notes: Hydrogen Fuel Cell Vehicles; Current Status and Future Prospect

Source Title	Hydrogen Fuel Cell Vehicles; Current Status and Future Prospect
Source citation (APA Format)	Manoharan, Y., Hosseini, S. E., Butler, B., Alzahrani, H., Senior, B. T., Ashuri, T., & Krohn, J. (2019). Hydrogen fuel cell vehicles; current status and future prospect. <i>Applied Sciences</i> , 9(11), 2296. <a href="https://doi.org/10.3390/app9112296">https://doi.org/10.3390/app9112296</a>
Original URL	<a href="https://www.mdpi.com/2076-3417/9/11/2296">https://www.mdpi.com/2076-3417/9/11/2296</a>
Source type	Scientific Journal Database
Keywords	importance, electrochemical device, hydrogen
Summary of key points + notes (include methodology)	The emissions created by current methods of transportation are the main pollutants of our environment now, causing mass environmental destruction. Hydrogen fuel cell vehicles run on an electrochemical device, which use gasses and oxidants as reactants to split an anion from its cation, creating electricity. This electricity is enough to power the standard vehicle, is extremely efficient, and can be stored inside the car easily.
Research Question/Problem/ Need	What are the benefits of FCVs and what makes them so efficient?
Important Figures	
VOCAB: (w/definition)	Electrochemical- a device that uses a chemical reaction to create energy, uses electricity to cause a chemical reaction, or both
Cited references to follow up on	
Follow up Questions	1. What would be the source of this hydrogen? Would it come from water and use an electrolysis device inside the vehicle or would it attempt to capture the hydrogen in our atmosphere?

- |  |  |
|--|--|
|  | <p>2. How would an electrochemical device being inside the car compare to a large electrochemical plant and multiple hydrogen “refuel” stations?</p> |
|--|--|

## Article #2 Notes: A Review of Hydrogen Purification Technologies for Fuel Cell Vehicles

Source Title	<i>A Review of Hydrogen Purification Technologies for Fuel Cell Vehicles</i>
Source citation (APA Format)	Du, Z., Liu, C., Zhai, J., Guo, X., Xiong, Y., Su, W., & He, G. (2021). A review of hydrogen purification technologies for fuel cell vehicles. <i>Catalysts</i> , 11(3), 393. <a href="https://doi.org/10.3390/catal11030393">https://doi.org/10.3390/catal11030393</a>
Original URL	<a href="https://www.mdpi.com/2073-4344/11/3/393">https://www.mdpi.com/2073-4344/11/3/393</a>
Source type	Scientific Journal Database
Keywords	purifying, hydrogen, industrial
Summary of key points + notes (include methodology)	Hydrogen has been used in an industrial setting for decades, but there it requires a higher “grade” of purity for use. In hydrogen fuel cell vehicles, some level of purity needs to be controlled and maintained, but that grade can be much lower. This allows for more methods of producing less-pure hydrogen for FCVs, opening up cheaper options.
Research Question/Problem/ Need	Why do factory/industrial hydrogen and FCV hydrogen have different standards for purity?
Important Figures	
VOCAB: (w/definition)	n/a
Cited references to follow up on	
Follow up Questions	<ol style="list-style-type: none"> <li>1. What does it mean for hydrogen gas to be pure and what is the standard for both factories and FCVs?</li> <li>2. Is there a way to utilize cheaply produced and “impure” hydrogen gas and purify it until it meets the international standard for FCVs or even factories? Would this be cheaper than just producing high-quality hydrogen immediately?</li> </ol>

# Article #3 Notes: PEM Water Electrolysis: Volume One

## Chapter Two

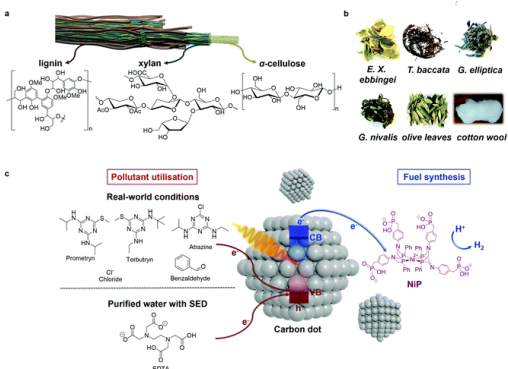

Article notes should be on separate sheets

Source Title	<b><i>PEM Water Electrolysis: Volume One Chapter Two</i></b>

Source type	Journal Article
Keywords	Hydrogen, plants, biomass,
Summary of key points + notes (include methodology)	Photoreactions and photocatalysts have existed as a way to produce hydrogen for many years, but they usually involve the use of a stable water pH, harmful metals like Titanium Dioxide and Nickel, and they can release toxins into the air during production. Scientists found a way to use dried plant matter (lignocellulose- the 2nd most abundant material on earth found in all things from dried plants to cotton tshirts) to create Carbon Dots or CDs, catalysts that replace the usually toxic catalysts in photoreactors. Now, hydrogen can be created simply by putting water (any water including waste water), biomass waste (CDs), and sunlight together to begin hydrogen ion synthesis.
Research Question/Problem/ Need	How can photocatalysis be made safer and more efficient? How can the costs of photoreactions be reduced?

<p>Important Figures</p>	 <p>The figure is divided into three parts: (a) shows the chemical structures of lignin, xylan, and <math>\alpha</math>-cellulose. (b) shows photographs of various biomass sources: <i>E. X. ebbingei</i>, <i>T. baccata</i>, <i>G. elliptica</i>, <i>G. nivalis</i>, olive leaves, and cotton wool. (c) is a schematic diagram of photocatalysis on a carbon dot. It shows a carbon dot with a core-shell structure (CB, VB, CB, VB) and a photocatalytic cycle involving <math>\text{H}_2\text{O}</math> and <math>\text{H}_2</math>. The cycle is divided into 'Pollutant utilisation' and 'Fuel synthesis'. 'Pollutant utilisation' shows the degradation of Promethyn, Tubufyn, Chloride, and Benzobaldehyde. 'Fuel synthesis' shows the production of NIP. The process is shown under 'Real-world conditions' and 'Purified water with SED' (EDTA).</p>
<p>VOCAB: (w/definition)</p>	<p>Photocatalysis- catalysis that results in a change of the rate of photoreaction (adding catalysts that speed up the light intake of plants) Lignocellulosic- dry plant matter</p>
<p>Cited references to follow up on</p>	<p><a href="https://pubs.acs.org/doi/10.1021/jp406523w">https://pubs.acs.org/doi/10.1021/jp406523w</a> <a href="https://pubs.acs.org/doi/10.1021/jacs.5b01650">https://pubs.acs.org/doi/10.1021/jacs.5b01650</a></p>
<p>Follow up Questions</p>	<ol style="list-style-type: none"> <li>1. If done with a type of biomass like algae, could the oils from the algae be extracted from the plant previous to the photoreaction- therefore creating two fuels from a singular source.</li> <li>2. Would algae contain a good cellulose-lignin ratio?</li> </ol>

# Article #5 Notes: Sustainable and Selective Extraction of Lipids and Bioactive Compounds from Microalgae

Article notes should be on separate sheets

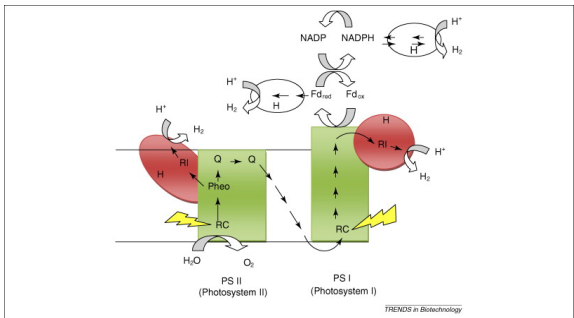

## KEEP THIS BLANK AND USE AS A TEMPLATE

Source Title	Sustainable and Selective Extraction of Lipids and Bioactive Compounds from Microalgae																		
Source citation (APA Format)	Santoro, I., Nardi, M., Benincasa, C., Costanzo, P., Giordano, G., Procopio, A., & Sindona, G. (2019). Sustainable and Selective Extraction of Lipids and Bioactive Compounds from Microalgae. <i>Molecules (Basel, Switzerland)</i> , 24(23), 4347. <a href="https://doi.org/10.3390/molecules24234347">https://doi.org/10.3390/molecules24234347</a>

Source type	Journal article																		
Keywords	algal oil, green chemistry, green solvents, extraction, biofuel, bio compound																		
Summary of key points + notes (include methodology)	This article discussed the many methods that can be used to extract lipids from algae. Previously, harmful chemicals were used as a method of processing algae into biofuels, but recently many teams of scientists worked together to find greener methods of producing oil by using various chemicals like supercritical carbon dioxide, ethanol, CPME, and more. It was found that algae had the highest oil yield when “EtOH/CPME (8:2) was used at a temperature of 80 °C and a reaction time of 60 min”																		
Research Question/Problem/ Need	How are lipids and fatty acids extracted from species of microalgae?

Source type	Journal article
Keywords	Fermentation, organic compounds, bioH <sub>2</sub> production, microbial electrolysis cells
Summary of key points + notes (include methodology)	In the past, hydrogen for industrial use has been produced only by the reformation of hydrocarbons or fossil fuels. However, BioH <sub>2</sub> can be produced using processes like fermentation, photosynthesis, and microbial electrolysis cells. These methods are effective, have high yields (but low efficiency) and have the potential to be completely carbon neutral.
Research Question/Problem/ Need	How can current methods of hydrogen production like electrolysis and fermentative methods be combined to create a newer and more efficient source of hydrogen production?
Important Figures	 <p>The diagram illustrates the photosynthetic pathway for hydrogen production. It shows Photosystem II (PS II) and Photosystem I (PS I) embedded in a membrane. At PS II, water (H<sub>2</sub>O) is split into oxygen (O<sub>2</sub>) and protons (H<sup>+</sup>). Electrons (e<sup>-</sup>) are transferred from PS II to a primary electron acceptor (Pheo), then to a secondary acceptor (Q), and finally to a reaction center (RC). At PS I, light energy excites electrons, which are then transferred to another RC and finally to ferredoxin (Fd<sub>ox</sub>/Fd<sub>red</sub>). The reduced ferredoxin (Fd<sub>red</sub>) reduces NADP<sup>+</sup> to NADPH, while protons (H<sup>+</sup>) are released. The overall process is shown as a cycle where NADPH is used to produce H<sub>2</sub> and H<sup>+</sup> are recycled back to NADP<sup>+</sup>.</p>

Source type	Journal Article
Keywords	Waste-to-Hydrogen, Gasification/pyrolysis, Biomass waste, Fuel cell technology, Sustainable waste management
Summary of key points + notes (include methodology)	WtH for fuel production seems like a promising field, as it reduces carbon emissions and GWP (global warming potential) as well as consuming a harmful resource. However, it has its limitations as WtH technologies are only currently available at an incredibly small scale and are extremely expensive. Additionally, WtH requires that the water be purified before use in fuel cell vehicles, another expensive and difficult factor.
Research Question/Problem/ Need	What are the benefits and setbacks of waste to hydrogen processes for fuel production?
Important Figures	<pre> graph LR     Waste["Waste MSW (and refuse derived fuel from MSW) Biomass Sewage sludge Packaging and plastics Solid recovered fuel"] --&gt; Technology["Technology Gasification Pyrolysis Fermentation Photolysis"]     Technology --&gt; Products["Products H<sub>2</sub> CO CO<sub>2</sub> CH<sub>4</sub> Possible particulates, N<sub>2</sub> or NH<sub>3</sub>"]     Products --&gt; Downstream["Downstream Processing Cleaning Reforming Separation and purification (e.g. PSA and membrane technologies)"]     Downstream --&gt; Storage["Storage Compressed storage (pressure vessels) Liquid storage (cryogenic tanks) Physisorption (e.g., graphene, metallic nanocrystals, etc.) Chemical adsorption (e.g., metal hydrides, borohydrides, etc.)"]     Storage --&gt; Application["Application Fuel cells (e.g., PEMFC, alkaline and SOFC) Transportation (e.g., buses)"]     </pre>

Source type	Journal Article
Keywords	Renewable fuels, food waste, biocrude, hydrothermal liquefaction
Summary of key points + notes (include methodology)	Food waste is an abundant, energy-dense, and polluting substance that has the potential to be utilized for biocrude oils. HAP or hydroxyapatite is a compound made of calcium and phosphorus found in bones and seashells that is stable at the same conditions hydrothermal liquefaction takes place. HAP at Ca:P ratios higher than 1.5 have the potential to be perfect catalysts for this process.
Research Question/Problem/ Need	How can harmful and polluting food waste be converted into biocrude using safe and abundant materials at a low cost?

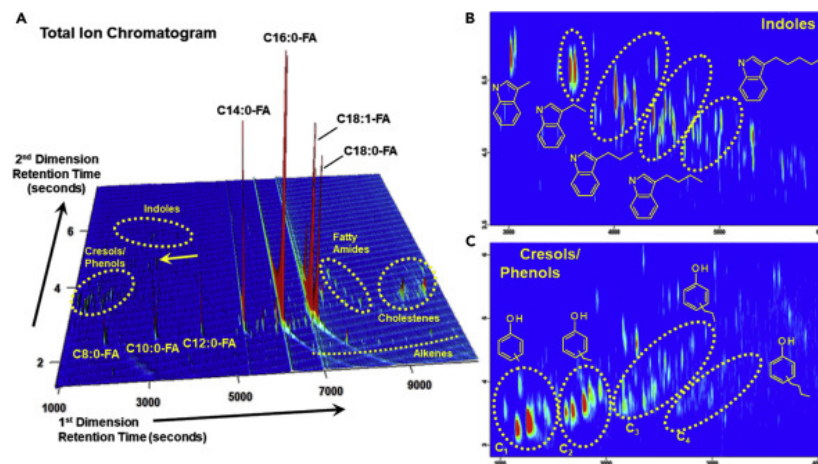

Important Figures

Mass yield of different substances when processed with HAP at different Ca:P ratios. The process worked best when Ca:P > 1.5

Ex situ methods when used with the aqueous phase of thermal methods were able to extract additional biocrude from the substance with little-no loss

## Article #10 Notes: Mechanochemical Pretreatment for Waste-Free Conversion of Bamboo to Simple Sugars: Utilization of Available Resources for Developing Economies

Article notes should be on separate sheets

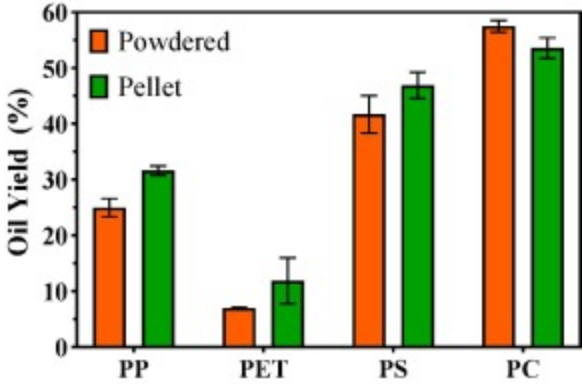

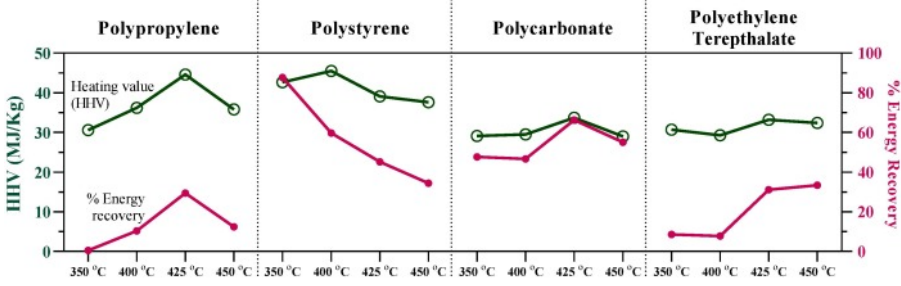

Source Title	Mechanochemical Pretreatment for Waste-Free Conversion of Bamboo to Simple Sugars: Utilization of Available Resources for Developing Economies
Source citation (APA Format)	Ekwe, Nneka B., et al. "Mechanochemical Pretreatment for Waste-Free Conversion of Bamboo to Simple Sugars: Utilization of Available Resources for Developing Economies." <i>Advanced Sustainable Systems</i> , vol. 6, no. 4, 2022, p. 2100286., doi:10.1002/adsu.202100286.
Original URL	<a href="https://onlinelibrary.wiley.com/doi/pdf/10.1002/adsu.202100286">https://onlinelibrary.wiley.com/doi/pdf/10.1002/adsu.202100286</a>
Source type	Journal Article
Keywords	Biofuel, agriculture, ball milling, crystalline structure, chemical reaction, bamboo, enzymes
Summary of key points + notes (include methodology)	Bambusa vulgaris (common bamboo) is one of the fastest growing plants in the world and can grow in arid climates. Bamboo was milled using mechanochemical techniques until cellulose structures were broken down. Samples of bamboo were then analyzed for their sugar content and new particle composition until it was determined which one could be best fermented and used for ethanol production. It was determined that bamboo samples milled for 30 minutes were most effective at changing the particle structure, and that if 30% of Nigeria's arid land was used for bamboo cultivation they could replace gasoline use with plant ethanol entirely.
Research Question/Problem/ Need	What is the best way to mill or process bambusa vulgaris for it to be used in fermentative processes (ethanol production)?

<p>Important Figures</p>	 <p>Micrographs of bamboo in various stages of treatment</p> <p>FT-IR spectra of untreated bamboo and ball-milled bamboo (chemical analysis of sugars and plant protein structures)</p>

Source type	Journal Article
Keywords	Plastic, Waste-to-Energy, Chemical recycling, Supercritical water processing, Circular economy
Summary of key points + notes (include methodology)	Plastics recycling is an incredibly difficult, environmentally unfriendly, wasteful, and time consuming process. Many types of plastics (like polystyrene- commonly known as styrofoam) are unable to be recycled using current methods. A possible solution to this issue is to use HTL to process various plastics into energy rich crude oils and monomers. This process is economically effective, as plastics are a waste product that can be obtained for negative \$. Additionally, this process created a byproduct of both oil that can be processed and used in vehicles, as well as monomers and other industrially useful chemicals. Both of these products can be sold and make this recycling technique more environmentally friendly and cost-effective.
Research Question/Problem/ Need	How can plastics be turned into crude oil for fuel use? How can a new method of plastics recycling be developed?

Source type	Journal article
Keywords	Lignocellulose, Oxidation, Aqueous, Renewable, Treatment, Sustainable
Summary of key points + notes (include methodology)	The aim of this article was to address the effects that oxygen has on HTL of softwoods. HTL was done in the presence or absence of about 5bar oxygen gas of 1.6 g/L sodium carbonate. The addition of oxygen was able to increase organic acids yield by 4x. It also increased oil/biocrude yields at low-moderate temperatures of 230-270°C. This knowledge advances production of sustainable fuels from renewable resources.
Research Question/Problem/ Need	What effect does oxygen have on HTL of softwood?
Important Figures	 <p>Graphical abstract</p>

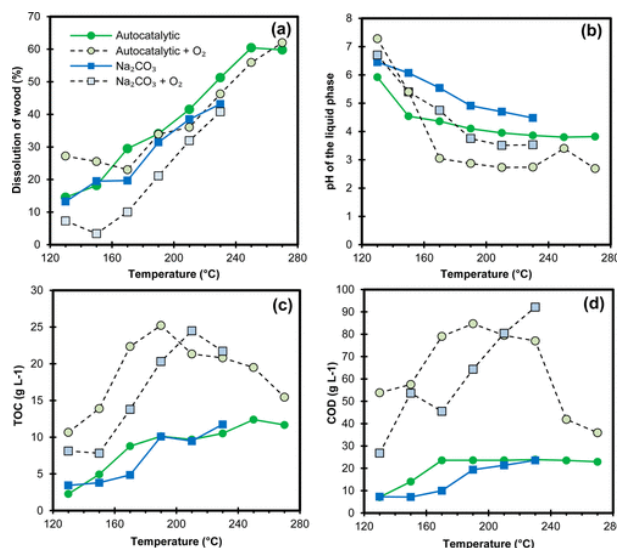

Figure 1. HTL of wood: (a) dissolution of wood and (b) pH, (c) total organic carbon (TOC), and (d) chemical oxygen demand (COD) of the liquid fractions obtained in autocatalytic and sodium carbonate containing (1.6 g/L) hydrothermal treatments as a function of temperature and in the presence or absence of 5 bar oxygen atmosphere.

<p>VOCAB: (w/definition)</p>	<p>Furans- heterocyclic organic compound. Is a clear highly flammable and volatile liquid at room temperature. It is soluble using common solvents like acetone, ethanol, methanol, and more. Furans can be found in low amounts in canned and jarred foods like soup, sauces, beans and baby food.</p>
<p>Cited references to follow up on</p>	<p><a href="https://doi.org/10.1016/S0196-8904(97)00047-2">https://doi.org/10.1016/S0196-8904(97)00047-2</a></p>
<p>Follow up Questions</p>	<p>No! Article was clear! Just read this to get familiar with the HTL process prior to experimenting</p>

## Article #13 Notes: Chemical recycling of plastics using sub- and supercritical fluids

Source Title	Chemical recycling of plastics using sub- and supercritical fluids
Source citation (APA Format)	Goto, M. (2009). Chemical recycling of plastics using sub- and supercritical fluids. <i>The Journal of Supercritical Fluids</i> , 47(3), 500–507.  <a href="https://doi.org/10.1016/j.supflu.2008.10.011">https://doi.org/10.1016/j.supflu.2008.10.011</a>
Original URL	<a href="https://doi.org/10.1016/j.supflu.2008.10.011">https://doi.org/10.1016/j.supflu.2008.10.011</a>
Source type	Journal Article
Keywords	Supercritical fluids, subcritical fluids, plastics recycling, monomers, chemical recycling
Summary of key points + notes (include methodology)	Sub and supercritical fluids have the ability to depolymerize plastics like PET, nylon, and polyurethane fairly. These plastics return their monomers in high yield. Epoxy and other resin-based plastics are depolymerized in the presence and absence of a catalyst. Commercial size plants have been developed that have the ability to recycle plastics using these methods. This method does not create biocrude like HTL does but can easily break down plastics into extremely useful products.
Research Question/Problem/ Need	What effect does sub/supercritical fluids like alcohol or water have on consumer-use plastics in different forms?

Follow up Questions	How cost effective and accessible is this device?

# Article #14 Notes: A review on hydrothermal liquefaction of biomass

Article notes should be on separate sheets

Source Title	A review on hydrothermal liquefaction of biomass
Source citation (APA Format)	Gollakota, A. R. K., Kishore, N., & Gu, S. (2018). A review on hydrothermal liquefaction of biomass. <i>Renewable and Sustainable Energy Reviews</i> , 81, 1378–1392. <a href="https://doi.org/10.1016/j.rser.2017.05.178">https://doi.org/10.1016/j.rser.2017.05.178</a>
Original URL	<a href="https://www.sciencedirect.com/science/article/pii/S1364032117308146">https://www.sciencedirect.com/science/article/pii/S1364032117308146</a>
Source type	Journal Article
Keywords	Wet biomass, Dry biomass, Hydrothermal liquefaction, HTL mechanism, Value-added chemicals, Energy efficiency
Summary of key points + notes (include methodology)	This article was incredibly dense as it was a review article on HTL of countless different biomass feedstocks, their ideal temperatures, compositions, and compositions of the oils they create. This article contained a list of 100 different feedstocks ranging from bovine manure to coffee grounds to spent brewery grain to dozens of species of algae. It also included the ideal temperatures and pressures from over 50 different feedstocks. I can't imagine how long it took to write this article.
Research Question/Problem/ Need	What are the chemical compositions of different biomasses? What are the ideal HTL conditions for different biomasses?
Important Figures	<pre> graph LR     Biomass -- degradation --&gt; WDM[Water-dissolved materials]     WDM -- Polymerization --&gt; Oil     Oil -- degradation --&gt; Gas     Oil -- Polymerization --&gt; Char     </pre>

## Patent #2 Notes: Ergonomic garden tool handle

Source Title	Ergonomic garden tool handle
Source citation (APA Format)	Stephen Van Valin. (2014, August 26). Ergonomic garden tool handle
Original URL	<a href="https://patents.google.com/patent/US9149925B1/en?q=garden+tool&amp;oq=garden+tool">https://patents.google.com/patent/US9149925B1/en?q=garden+tool&amp;oq=garden+tool</a>
Source type	Patent
Keywords	garden tool, elderly, ergonomic
Summary of key points + notes (include methodology)	This patent is for an ergonomic garden tool handle. It is designed for one handed use and forearm support. There is an upside down “U” shaped handle at the middle of the tool’s shaft- that can be adjusted by removing and replacing screws. This tool would be beneficial for a person who has limited mobility in one of their arms and can only operate with one hand.
Research Question/Problem/ Need	Some people experience limited mobility in their arms or other limbs and therefore require a device that can be easily used with one hand.
Important Figures	<a href="https://patentimages.storage.googleapis.com/52/3f/96/23940766a23e84/US09149925-20151006-D00000.png">https://patentimages.storage.googleapis.com/52/3f/96/23940766a23e84/US09149925-20151006-D00000.png</a>
VOCAB: (w/definition)	n/a
Cited references to follow up on	n/a
Follow up Questions	How fatigued would the user be after having to use only one arm? How heavy would this device be?
