Commented [CK1]: 10/3/2024 6 full entries

Keep your knowledge gaps and lit. search parameters updated.

Include detailed captions on pasted figures.
Check your APA citation format.
Make sure you are consistent with adding vocab and definitions.

Commented [2]: remember to share with Dr. C.

Commented [CK3]: 12/19/2024

Be consistent when adding vocab w/definitions.
Double-check your APA citation format.
Keep your Literature search parameters and knowledge gaps up to date.

Had you thought about revising your other entries based on prior comments?

Commented [4]: Table of contents will be generated if using a HEADER format for each sub-section.

KEEPING THIS UP-TO-DATE WILL HELP YOU when it comes time to write your thesis.

Last Name 1

Knowledge Gaps:

This list provides a brief overview of the major knowledge gaps for this project, how they were resolved and where to find the information.

Knowledge Gap	Resolved By	Information is located	Date resolved

Commented [5]: Up date this page regularly as this can facilitate the writing process.

Commented [6]: Because this is a living document, you will be updating this table regularly, therefore it doesn't make sense to worry about organizing every time you open this sheet. Remember the A-Z Sort tool. You can sort based on how you resolved your issue, or you can choose a different organizational method. For example, you could add a column for date resolved and organize chronologically.

Commented [7]: Your notes file will grow as you continue to read. As a result, your page numbers might change. How do you ensure your references remain useful?

1. You could include enough information to find the notes page without a page number. Be careful of just using author names because you might have more than one source from the same first author. If you include title or full citation, that should be enough.
2. Insert a cross-reference
 - a. insert tab, cross-reference
 - b. If you choose this path DON'T FORGET TO UPDATE THE FIELDS before you submit or print

Literature Search Parameters:

These searches were performed between (Start Date of reading) and XX/XX/2019.
List of keywords and databases used during this project.

Database/search engine	Keywords	Summary of search

Commented [8]: This can help you keep track of the searches you perform and what you searched for so that redundancy does not occur.

Commented [9]: This might seem like a silly addition, but if you read literature reviews or meta-analyses, you will notice this information is preserved. It is good practice to record how you found your information.

Summary of key points + notes (include methodology)	This research article is about a lower appendage prosthesis device acting similarly to how a human ankle joint would function. This allowed those who were part of the testing to use neurological signals to move the prosthetic and balance under controlled stress on their center of gravity. This could be a large step towards fully controllable limbs, as balance is something many people with these prosthetics struggle with, and now they might be able to perform balance required tasks.
Research Question/Problem/Need	Those with lower limb prosthetic devices have differences in their ability to balance than able bodied people. This results in balancing issues, and inability to perform some tasks.
Important Figures	
VOCAB: (w/definition)	EMG-electromyographic signals, transtibial amputation- a surgical procedure that removes the foot, ankle joint, distal tibia, and fibula, as well as related soft tissue structures, anticipatory- anticipating movement, compensatory- movement as a response to stimuli or a corrective movement.
Cited references to follow up on	F. B. Horak, Postural orientation and equilibrium: What do we need to know about neural control of balance to prevent falls? <i>Age Ageing</i> 35, ii7–ii11 (2006). C. Summary of key points + notes (include methodology)	A prosthetic hand was created so a participant could feel temperature through his own nervous system. The participant was able to tell between hot and cold objects, and could even tell the difference between a fake hand and a real hand based on temperature. Feeling heat is important for safety reasons, like avoiding objects that are too hot or too cold. But it is also important for a more human aspect of communication and emotion. This was the main reason for this study and invention.
Research Question/Problem/Need	Prosthetics don't help with senses like touch or temperature. Can be dangerous without feeling heat.

Important Figures	 <p>Image credit: © 2024 EPFL/Caillet</p>
VOCAB: (w/definition)	Phantom Limb- amputees often continue to sense their lost limb as if it were still there, thermode-connection to the temperature nerves of the nervous system.
Cited references to follow up on	
Follow up Questions	How accurately can the prosthetic detect temperature? Can this technology be applied to touch as well? Does the prosthetic require specific setup depending on the participant or does it work universally?

Commented [18]: Questions are crucial in leading you towards the next paper. This is a MANDATORY section and should include AT LEAST 3 Questions that stem from reading the paper.

Summary of key points + notes (include methodology)	This study researched how musicians are naturally better at perceiving and understanding emotion. They are more able to relate to it, and feel compassion to those around them. Through having participants try to focus while also listening to the sound of a baby crying, the researchers could scan the brain waves and see that musicians were more empathetic towards the sound. This could apply to other areas of life where determining emotion takes place, and could even help those with dyslexia or other language disorders.

Commented [19]: Remember to take notes and summarize the work in your own words. Doing this upfront will help you avoid PLAGIARISM.

Summary of key points + notes (include methodology)	Musical ability to hear specific sounds through noise becomes most prevalent in later stages of life, so older people with a background in music might be less affected by this form of cognitive deterioration. The areas of the brain that tend to deteriorate in old age, should be the same areas that are trained and supported through music training. Musical training might help because those areas of the brain are more developed due to more consistent work, or because this training allows musicians to gain support from other areas of the brain to compensate for deterioration. By having participants of all ages and levels of musical backgrounds perform a number of cognitive tests, including listening for speech through noise, the study was able to see how similar older musicians were to older non-musicians, as well as younger non-musicians, in terms of ability to pick out speech through sound. It was found that in terms of picking out the correct syllable through noise, older musicians did just as well as younger non-musicians, while older non-musicians did far worse.

Commented [22]: Remember to take notes and summarize the work in your own words. Doing this upfront will help you avoid PLAGIARISM.

Commented [23]: If you keep this as a HEADER- it will show up in your Table of Contents automatically.

Research Question/Problem/Need	Can a background in music help prevent or slow the effects of cognitive deterioration as a result of age?

<p>#Tags</p>	
<p>Summary of key points + notes (include methodology)</p>	<p>Our somatosensory system which allows us to feel pain and touch is incredibly important for survival. It is also necessary for many of our daily dexterous tasks. Some nerve endings (merkel cells and ruffini endings) are slow adapting and give information based on sustained nerve loads, while others (meissner and pacinian corpuscles) are rapidly adapting and react immediately to stimuli. This study is looking into upper limb prosthetics which could restore tactile feeling. Artificial skin with receptors acting similarly to nerve endings have also been developed. Current prosthetics don't take into account to potential danger that pain can prevent, so this study attempted to apply this to a prosthesis by having an instant release of a "painful" object as a real arm reflex would. Using fake skin like material with imbedded mechanical sensory receptors, this study created a representation of how touch works in a real limb. Connecting this "feeling" ability to the participant through electrode connections to the residual nerves in their arm, the participant would be able to feel the sharpness or shape of the object. This was shown to be true as the participant could feel when the sensors were being stimulated, and could tell between differently sharpened objects.</p>
<p>Research Question/Problem/Need</p>	<p>Can a pain based release reflex be added to a prosthetic to help reduce harmful situations?</p>
<p>Important Figures</p>	 <p>The diagram illustrates a closed-loop system for a prosthetic arm. On the left, a human head shows 'Sensory Perception' in the brain. A 'Stimulator' box is connected to the brain and the prosthetic arm. The prosthetic arm features a 'Prosthesis Controller' and a sensor that outputs an 'E-dermis Signal' (Pressure in kPa), shown as a graph with a sharp peak. This signal is processed by a 'Neuromorphic Model' (represented by a neural spike train) which then sends signals back to the 'Stimulator' for 'Transcutaneous Nerve Stimulation' to the user's arm.</p>

VOCAB: (w/definition)	
Cited references to follow up on	
Follow up Questions	Can this be applied to all parts of the prosthetic or just sensitive areas like finger pads? Does the reflex need to be as strong if the prosthetic won't get as damaged as a normal limb? How good of a condition do the residual nerves need to be for this system to work accurately?

Commented [KC27]: Questions are crucial in leading you towards the next paper. This is a MANDATORY section and should include AT LEAST 3 Questions that stem from reading the paper.

Commented [28]: Remember to take notes and summarize the work in your own words. Doing this upfront will help you avoid PLAGIARISM.

Commented [29]: If you keep this as a HEADER- it will show up in your Table of Contents automatically.

<p>Summary of key points + notes (include methodology)</p>	<p>The human brain is able to adjust and adapt to environments and conditions. Musical training is an intense process that goes on for many years, and thus this study wanted to research its ability to promote brain development. This development could be especially important to younger children. This study tested two groups of children with a mean age of 6 years old, and who had no prior musical training or knowledge. One group was given weekly half hour lessons in how to play the keyboard, and the other group was not given this training, but had weekly 40 music class in school with singing, bells, and drums. This study went on for 15 months in which the cognitive development of the two groups was recorded using behavioral tests and an MRI before and after the 15 months with the musical training. The musically relevant tests were the only ones to show significant difference between the two groups. They tested for brain deformation occurrences at baseline (before musical training), brain deformation differences over time, and intensity differences between groups for a relationship of behavioral changes. There was significant differences in the changes that occurred to behavior in the two groups. The instrumental group did far better in the motor control test for the right hand, and moderately better in the left hand as well. The instrumental group also preformed better in auditory and rhythm determination tests.</p>
<p>Research Question/Problem/ Need</p>	<p>How does musical training affect brain development, specifically in younger children?</p>
<p>Important Figures</p>	<p>Primary motor area (Instrument > Controls)</p> <p>Right precentral gyrus</p> <p>x = 40</p> <p>3.4 t-statistic 5.9</p> <p>a</p> <p>Relative voxel size</p> <p>ΔControls ΔInstrument</p> <p>b</p> <p>Relative voxel size</p> <p>Δ Motor task-Left hand</p> <p>r=0.45, P=0.02</p>
<p>VOCAB: (w/definition)</p>	<p>Voxel-A voxel is a three-dimensional counterpart to a pixel. It represents a value on a regular grid in a three-dimensional space.</p>
<p>Cited references to follow up on</p>	

Follow up Questions	How does this effect change with a group that has no musical experience? How does continued training affect further brain development into late childhood? Does this change the brain structure or function of adults or does this require brain development?
----------------------------	---

Commented [30]: Questions are crucial in leading you towards the next paper. This is a MANDATORY section and should include AT LEAST 3 Questions that stem from reading the paper.

Summary of key points + notes (include methodology)	Many diagnoses for DOCs are incorrect and no real metric has been found and used. This study researched and tested the deactivation of DMNs in patients with various DOCs as well as healthy participants to see if the deactivation of these networks could be correlated to the level of consciousness a patient was capable of. Out of three features of DMNs, one has been studied far less than the other two, and this is the deactivation of these regions during cognitive tasks that require large amounts of attention. Participants were told to listen closely to 64 short sentences through 2 sessions in a random order. They were told to answer true or false surrounding the statement that was said in each sentence. During this testing, the DMN regions in question were being monitored with one of three fMRI scanners. The results of this study showed that the deactivation of DMNs was reduced in some DOCs like MCS, and completely absent in DOCs like UWS compared to high levels of deactivation for healthy participants. Because of this, it was concluded that lack of deactivation of DMNs is a sign of an interrupted mental stream, and therefore is a potential sign that a patient might have a DOC.
Research Question/Problem/Need	Can consciousness disorders be diagnosed through the study of task induced deactivation of default mode networks?

<p>Important Figures</p>	<p>The figure consists of four box plots and three brain slices. The box plots show connectivity values for Controls, MCS, and UWS groups in four regions: Medial parietal, Medial frontal, rMTG, and IMTG. The y-axis for all plots ranges from -1.0 to 1.0. The brain slices show highlighted regions in yellow and red, with a color scale from 0 to 6.</p> <table border="1"> <caption>Approximate connectivity values from box plots</caption> <thead> <tr> <th>Region</th> <th>Controls</th> <th>MCS</th> <th>UWS</th> </tr> </thead> <tbody> <tr> <td>Medial parietal</td> <td>-0.6</td> <td>-0.5</td> <td>0.2</td> </tr> <tr> <td>Medial frontal</td> <td>-0.5</td> <td>0.0</td> <td>0.4</td> </tr> <tr> <td>rMTG</td> <td>-0.4</td> <td>0.2</td> <td>0.3</td> </tr> <tr> <td>IMTG</td> <td>0.0</td> <td>0.7</td> <td>0.3</td> </tr> </tbody> </table>	Region	Controls	MCS	UWS	Medial parietal	-0.6	-0.5	0.2	Medial frontal	-0.5	0.0	0.4	rMTG	-0.4	0.2	0.3	IMTG	0.0	0.7	0.3
Region	Controls	MCS	UWS																		
Medial parietal	-0.6	-0.5	0.2																		
Medial frontal	-0.5	0.0	0.4																		
rMTG	-0.4	0.2	0.3																		
IMTG	0.0	0.7	0.3																		
<p>VOCAB: (w/definition)</p>	<p>DOC-disorder of consciousness, MCS-minimally conscious state, DMN-Default mode network, UWS-unresponsive wakefulness syndrome</p>																				
<p>Cited references to follow up on</p>	<p>Owen A.M., Coleman M.R. (2008). Using neuroimaging to detect awareness in disorders of consciousness. <i>Funct Neurol</i> 23, 189–194. DOI: 10.1097/AIA.0b013e318181adcc</p>																				

Follow up Questions	Can EEG technology be used to scan activation levels of similar brain areas? What are other sensory test capable of studying the activation levels of brain regions? Were there any other areas that a spike or fall was observed in, and how could those contribute to the potential use of DMN regions as a test for DOCs?

Summary of key points + notes (include methodology)	Brainwaves of different frequencies can be connected to different emotions, as well as states of mind. By studying these bioelectric system, we can gain further insight into what areas of the brain are being connected to, and used for a specific task, by observing what regions are experiencing these different waves. It was found that alpha and theta frequencies are important for memory and motor control. It was also found that delta frequencies usually correlate to calm feelings.
Research Question/Problem/Need	This article talks about identifying what brainwave frequencies connect to what emotions and actions.
Important Figures

Summary of key points + notes (include methodology)	The authors of this study hoped to find a correlation between delta brain waves and BOLD/DMN deactivation. This would gain a better understanding of what goes on when no active task is being performed vs when a deactivation level task is occurring. They also wanted to see if EEG technology could be used to study these deactivations, along with fMRI equipment. fMRI and EEG are used together to gain info from both temporal and spatial resolutions. The results show that Beta and Delta powers were directly correlated with the DMN signals, meaning that the DMN regions do not function as a single unit, and different parts function off of different brainwave frequencies.
Research Question/Problem/Need	To provide more evidence to support the idea that different EEG frequencies can be directly correlated to the deactivation of DMN regions.

<p>Important Figures</p>	
<p>VOCAB: (w/definition)</p>	<p>EEG- Electroencephalography or the process of reading the frequency of the electromagnetic waves produced by the brains functions, DMN-default mode network, RSN-resting state network, BOLD-blood oxygenation level dependent,</p>

Summary of key points + notes (include methodology)	This study attempted to show correlation between EEG band powers and the FC of DMN regions. 20 healthy volunteers were tested with both EEG and fMRI technology, and found a strong correlating relationship between the DMN FC areas, and the powers of the EEG frequencies. Increased delta power and decreased beta power could be connected to DMN hypoconnectivity. Lower power EEG signals were correlated with increased connectivity, and therefore more interactions in the default mode areas of the brains network functioning.																																																																																																									
Research Question/Problem/Need	Can EEG patterns help to predict reduced connectivity in DMN regions?																																																																																																									
Important Figures	<p>The figure is a grouped bar chart titled 'EEG spectral power (a.u.)' on the y-axis and 'subject index' on the x-axis. The y-axis ranges from 0 to 15 with increments of 5. The x-axis is labeled 'subject index' and ranges from 1 to 20. A legend in the top right corner identifies four EEG bands: delta (black), theta (dark gray), alpha (medium gray), and beta (light gray). For each subject, there are four bars representing these bands. The delta band consistently shows the highest power across most subjects, with a notable peak for subject 11. The beta band generally shows the lowest power.</p> <table border="1"> <caption>Approximate EEG spectral power values (a.u.) for 20 subjects</caption> <thead> <tr> <th>Subject Index</th> <th>delta</th> <th>theta</th> <th>alpha</th> <th>beta</th> </tr> </thead> <tbody> <tr><td>1</td><td>5.5</td><td>3.0</td><td>2.5</td><td>1.0</td></tr> <tr><td>2</td><td>2.5</td><td>2.0</td><td>1.5</td><td>1.0</td></tr> <tr><td>3</td><td>2.0</td><td>1.5</td><td>1.0</td><td>1.0</td></tr> <tr><td>4</td><td>3.5</td><td>2.0</td><td>1.5</td><td>1.0</td></tr> <tr><td>5</td><td>2.5</td><td>2.0</td><td>1.5</td><td>1.0</td></tr> <tr><td>6</td><td>3.0</td><td>2.5</td><td>2.0</td><td>1.0</td></tr> <tr><td>7</td><td>8.0</td><td>6.5</td><td>3.0</td><td>1.0</td></tr> <tr><td>8</td><td>4.0</td><td>3.0</td><td>2.0</td><td>1.0</td></tr> <tr><td>9</td><td>3.5</td><td>3.0</td><td>2.0</td><td>1.0</td></tr> <tr><td>10</td><td>2.5</td><td>2.0</td><td>1.5</td><td>1.0</td></tr> <tr><td>11</td><td>11.0</td><td>5.5</td><td>3.0</td><td>1.0</td></tr> <tr><td>12</td><td>4.5</td><td>4.0</td><td>3.0</td><td>1.0</td></tr> <tr><td>13</td><td>4.5</td><td>3.5</td><td>2.5</td><td>1.0</td></tr> <tr><td>14</td><td>4.0</td><td>3.0</td><td>2.0</td><td>1.0</td></tr> <tr><td>15</td><td>2.0</td><td>1.5</td><td>1.0</td><td>1.0</td></tr> <tr><td>16</td><td>2.0</td><td>1.5</td><td>1.0</td><td>1.0</td></tr> <tr><td>17</td><td>11.0</td><td>8.0</td><td>4.0</td><td>1.0</td></tr> <tr><td>18</td><td>4.5</td><td>3.5</td><td>2.5</td><td>1.0</td></tr> <tr><td>19</td><td>5.0</td><td>3.5</td><td>2.5</td><td>1.0</td></tr> <tr><td>20</td><td>6.0</td><td>3.0</td><td>2.0</td><td>1.0</td></tr> </tbody> </table>	Subject Index	delta	theta	alpha	beta	1	5.5	3.0	2.5	1.0	2	2.5	2.0	1.5	1.0	3	2.0	1.5	1.0	1.0	4	3.5	2.0	1.5	1.0	5	2.5	2.0	1.5	1.0	6	3.0	2.5	2.0	1.0	7	8.0	6.5	3.0	1.0	8	4.0	3.0	2.0	1.0	9	3.5	3.0	2.0	1.0	10	2.5	2.0	1.5	1.0	11	11.0	5.5	3.0	1.0	12	4.5	4.0	3.0	1.0	13	4.5	3.5	2.5	1.0	14	4.0	3.0	2.0	1.0	15	2.0	1.5	1.0	1.0	16	2.0	1.5	1.0	1.0	17	11.0	8.0	4.0	1.0	18	4.5	3.5	2.5	1.0	19	5.0	3.5	2.5	1.0	20	6.0	3.0	2.0	1.0

Commented [48]: If you keep this as a HEADER- it will show up in your Table of Contents automatically.

	<ul style="list-style-type: none"> Recorded differing brainwaves and their strengths Delta (0.5–3.5 Hz) power was predominantly distributed in the prefrontal area, with an increase in field power from EC to EO. Theta (4–7 Hz) power was found in the fronto-central region and decreased significantly from EC to EO. Alpha-1 (7.5–9.5 Hz) and Alpha-2 (10–12 Hz) power was mostly in the posterior brain areas, with a significant reduction in power from EC to EO. Beta-1 (13–23 Hz) showed a similar distribution to alpha-2 and also exhibited reduced power from EC to EO. Beta-2 and Gamma frequencies showed no significant change in spatial distribution or power between EC and EO. Default mode networks reflect brain activity that can be used to assess brain functions in all individuals
Research Question/Problem/Need	Are there EEG-DMN differences between eyes open and eyes closed patients?

Follow up Questions	<p>Do epileptic regions have connections to DMN regions? What makes EEG and fMRI important to the scanning of these regions? What do they scan and map that other methods cannot?</p>

Commented [74]: Questions are crucial in leading you towards the next paper. This is a MANDATORY section and should include AT LEAST 3 Questions that stem from reading the paper.

Article #20 Notes: Title

Article notes should be on separate sheets

Summary of key points + notes (include methodology)	<ul style="list-style-type: none"> • Most info surrounding brain region connectivity has been achieved through fMRI • EEG could provide further insights that other methods including fMRI have not been able to achieve • Whole brain dynamics and electrophysiological connectivity are unknown areas and are relatively unstudied • EEG can assist in knowledge surrounding these areas • Brain regions surrounding this connectivity were scanned with both fMRI and EEG equipment • Focus primarily on rest areas of the brain • Conclusions show that some information is overlapped between the two methods • EEG also provided information that fMRI did not show
Research Question/Problem/Need	To gain insights as to the connectivity of certain brain regions through both fMRI and EEG study

Commented [75]: Remember to take notes and summarize the work in your own words. Doing this upfront will help you avoid PLAGIARISM.

Commented [76]: If you keep this as a HEADER- it will show up in your Table of Contents automatically.

<p>Important Figures</p>	<p>The diagram illustrates the workflow for EEG-fMRI connectivity analysis. Part (a): EEG and fMRI data are processed. EEG is converted to source space, and fMRI is processed through ROI average and Desikan atlas. This leads to imaginary coherence and Pearson's R matrices, which are then compared to A, B, C, D, E EEG and fMRI data. Part (b): Phase randomization (temporal) is used to create a null model. This involves generating FMRI pseudo connectivity and EEG connectivity. Mutual information (MI) is calculated between EEG and FMRI dynamic connectivity for each connection. This results in an EEG-fMRI MI matrix for each subject, which is then used for connection-wise statistics and network analysis.</p>

<p>Follow up Questions</p>	<p>Are there other methods besides fMRI and EEG that could provide even more insights? Do certain technologies work better for certain brain areas or functions? Why are these brain areas so misunderstood, and why has data not been collected on them before?</p>

Commented [77]: Questions are crucial in leading you towards the next paper. This is a MANDATORY section and should include AT LEAST 3 Questions that stem from reading the paper.
