## Knowledge Gaps:

This list provides a brief overview of the major knowledge gaps for this project, how they were resolved and where to find the information.

Knowledge Gap	Resolved By	Information is located	Date resolved
How do Viral Vectors Function?	Reading an article on a Viral Vector Vaccine	Project Notes Article #2	9/20/24
Importance of Neoantigens in Cancer Immunotherapy	Reading an article on the importance of Neoantigens.	Project Notes Article #7	10/6/24
How do dendritic cell vaccines function?	Reading an article on a dendritic cell cancer vaccine.	Project Notes Article #5	9/25/24
What is a viable alternative to FBS?	Reading an article on potential FBS alternatives.	Project Notes Article #16	11/6/24
Can depression be cured using prebiotics and probiotics?	Reading an article on the benefits of prebiotics and probiotics in regard to depression.	Project Notes Article #15	11/12/24
What is depression like in drosophila?	Reading an article on how to measure depression in drosophila and the symptoms of it.	Project Notes Article #17	11/23/24
What is the connection between gut health and depression?	Reading three articles on the connection between gut health and depression as well as its cures.	Project Notes Articles #18-20	12/10/24

## Literature Search Parameters:

These searches were performed between (Start Date of reading) and XX/XX/2019.

List of keywords and databases used during this project.

Database/search engine	Keywords	Summary of search
WPI Library	Cancer Vaccine	I found one of my articles using this search parameter.
WPI Library	viral vector neoantigen targeting vaccine	I found the article "Phase I Trial of Viral Vector-Based Personalized Vaccination Elicits Robust Neoantigen-Specific Antitumor T-Cell Responses".
Google Patents	Dendritic cell immunotherapy	I found my second patent using this.
WPI Library	combination therapy for cancer vaccine	I found article #13
Google	Effects of prebiotics on depression	I found Article #20
Google	prebiotics and probiotics in depression	I found Article #15

<b>Source type</b>	Website article
<b>Keywords</b>	Cardiovascular Disease, Diagnosis, Treatment
<b>#Tags</b>	
<b>Summary of key points + notes (include methodology)</b>	<p>The article “AHA names top advances in cardiovascular disease research for 2023” is mainly about the innovations in treatment and diagnosis for CVDs last year. The article initially starts by explaining the significance of the many advancements made as cardiovascular diseases claim the lives of 850,000 lives every year in the United States and they are also the leading cause of death and disabilities across the globe. The American Heart Association is also the leading funder for all research related to the heart and strokes. The first advancement the article explains is a drug that combats hypertension. Hypertension, also known as high blood pressure, affects about half of the adult population of the United States. Hypertension increases the risk for myocardial infarctions, also known as heart attacks. The article also states that hypertension could reduce the life expectancy of a person by up to five years. Hypertension is considered present if blood pressure is consistently above or at 130/80 mmHg. Unfortunately, only about 25% of patients being treated for hypertension are able to get it within the recommended range which is below 130/80 mmHg. A protein secreted by liver, angiotensinogen, plays an important role in elevating blood pressure levels. However, a drug which is still under investigation, Zilebesiran, is known to decrease the production of Angiotensinogen. A study conducted about this drug showed that over eight weeks those individuals who had an intake of doses of 200mg or more of Zilebesiran saw a reduction in their blood pressure levels. The second advancement explains how endovascular thrombectomy could allow severe stroke victims to be more independent. An endovascular thrombectomy is a surgical procedure</p>

that involves removing the blood clot from the block artery. After severe stroke occurs, the victim is almost always very limited mentally and physically. This forces them to be dependent on others for many different tasks. However, a variety of studies show that endovascular thrombectomy limits the damage on the patient mentally and physically. A more limited amount of damage allows the patient to be much more independent as they are able to do more tasks without help. The third advancement the article explains is an imaging system which could reduce the enhance the placement of a stent in people with complex coronary lesions. There are two main imaging methods that are used during stent placement, angiography and intravascular imaging. A major type of intravascular imaging is known as optical coherence tomography or OCT. Both of these types of imaging methods are used to guide stent placement. Through four studies conducted that compared OCT-guided stent placement to angiography-guided stent placement, it was found that OCT-guided stent placement was more beneficial for patients. The fourth advancement in this article is the use of anticoagulant drugs for stroke victims that have AFib within a short time period. Currently, doctors wait a few days before giving anticoagulant drugs to the stroke victim. However, a new study is showing that treatment could safely begin much earlier. This is mainly shown as there was actually slightly lower risk for recurrent strokes and bleeding outside the brain from earlier treatment. The fifth advancement in this article is diabetes drugs being able to offer heart protection for those who do not have diabetes. These drugs that also lower glucose have been shown to also improve the heart health of obese people who do not have diabetes. Semaglutide, a medicine for long-term weight management that uses glucose reduction, has been shown to lead to greater reductions in heart failure related symptoms. The sixth advancement in this article was about the disparities in cardiovascular disease related deaths among different races and regions. An analysis that the article uses shows that rural counties and counties with high Black populations tend to have higher cardiovascular death rates. The seventh advancement in the article explains that in a new study with around 100,000 people there was a strong correlation between a variety of healthy eating and a lower death risk. The eighth advancement in the article explains a very new connection called the cardiovascular-kidney-metabolic syndrome (CKM) syndrome. As the name suggests, the syndrome represents a connection between obesity, chronic kidney disease, diabetes and cardiovascular disease. Poor CKM health has also been connected to disabilities and premature death. The ninth and final advancement in this article is about the treatment options for people with limb-threatening peripheral arterial disease (PAD). This disease involves the narrowing or blockage of a blood vessel between the heart and limbs. There are two main methods to treat limb-threatening PAD, namely, bypass surgery and endovascular therapy. Interestingly, a few studies have shown that there is relatively no difference in survival rate from the two different methods. With that the article summarizes the major cardiovascular advancements in 2023.

<b>Research Question/Problem/Need</b>	What are the new technologies and discoveries in cardiovascular health of the past year?
<b>Important Figures</b>	CVD claims more than 850000 lives in the United States every year.
<b>VOCAB: (w/definition)</b>	Hypertension – High blood pressure (persistently at least 130/80 mmHg)
<b>Cited references to follow up on</b>	None (Does not list references)
<b>Follow up Questions</b>	Could a similar syndrome like the CKM syndrome be developed for how mitochondrial dysfunction affects heart disease? Can diabetes drugs treat mitochondrial dysfunction as they can provide protection against heart disease? Since hypertension can lead to mitochondrial dysfunction, could Zilebesiran it as hypertension causes it?

## Article #2: Personalized Cancer Vaccines Go Viral: Viral Vectors in the Era of Personalized Immunotherapy of Cancer

<b>Source Title</b>	Personalized Cancer Vaccines Go Viral: Viral Vectors in the Era of Personalized Immunotherapy of Cancer
<b>Source citation (APA Format)</b>	Secli, L., Leoni, G., Ruzza, V., Siani, L., Cotugno, G., Scarselli, E., & D'Alise, A. M. (2023). Personalized cancer vaccines go viral: Viral vectors in the era of personalized immunotherapy of cancer. <i>International Journal of Molecular Sciences</i> , 24(23), 16591. <a href="https://doi.org/10.3390/ijms242316591">https://doi.org/10.3390/ijms242316591</a>

<b>Source type</b>	Peer-Reviewed Journal Article
<b>Keywords</b>	personalized cancer vaccines; neoantigens; viral vectors; adenovirus; poxvirus
<b>#Tags</b>	#Introduction
<b>Summary of key points + notes (include methodology)</b>	<p>Personalized cancer vaccines are a mostly untapped area with significant potential. Currently there is only one cancer vaccine in the market (not personalized) and it is not very effective. This is mainly due to the lack of proper antigens. However, new and upcoming methods to develop these vaccines are allowing for neoantigens to be used. This will provide better antigens and could possibly lead to an effective vaccine. The antigen options also need to be filtered through in order to select them. There is also the supply chain issue with personalized cancer vaccines as they would have to be tailored to suit every patient.</p> <ul style="list-style-type: none"> <li>• Neoantigens activate Dendritic cells</li> <li>• Most of the current vaccines target TAAs</li> <li>• Targeting TSAs is much better as they are only expressed by cancer cells</li> <li>• Most neoantigens come from point mutations of small indels</li> <li>• Only 1-2% of potential neoantigens have the potential to effectively stimulate the immune system to fight cancer</li> <li>• Examines the current personalized cancer vaccines' clinical trials</li> <li>• Issues with manufacturing personalized vaccines due to cost and the time it would take to produce and deliver a vaccine for one person</li> </ul>

	<ul style="list-style-type: none"> <li>CD8 T cells are the best response system in immunity</li> </ul>
<b>Research Question/Problem/Need</b>	Can personalized cancer vaccines be created effectively and efficiently with the new technology that exists?
<b>Important Figures</b>	49 of the 400 ongoing clinical trials for cancer vaccines are personalized cancer vaccines. There is a chart of data for a few clinical trials.
<b>VOCAB: (w/definition)</b>	Neoantigens (TSAs) – Also known as tumor specific antigens, these antigens are only presented on tumor cells. (TAAs) – Tumor associated antigens that are antigens that are presented on tumor cells as well as other cells. Tumor Mutation Burden (TMB) – Total number of substitutions, insertions, and deletions per megabase in the exon coding region.
<b>Cited references to follow up on</b>	<ul style="list-style-type: none"> <li>Finn, O.J. The Dawn of Vaccines for Cancer Prevention. <i>Nat. Rev. Immunol.</i> 2018, 18, 183–194. <b>Follow up Questions</b>	<p>Is there an effective method to target these neoantigens yet?</p> <p>Is it possible to produce artificial neoantigens and then insert them in a vaccine to create a map of where cancer is in the body?</p> <p>Is there an effective method to possibly extract a neoantigen and use that personalized sample to create a vaccine?</p>

## Article Number #3: Quantum computing's potential for drug discovery: Early stage industry dynamics

<b>Source Title</b>	Quantum computing's potential for drug discovery: Early stage industry dynamics
<b>Source citation (APA Format)</b>	Zinner, M., Dahlhausen, F., Boehme, P., Ehlers, J., Bieske, L., & Fehring, L. (2021). Quantum computing's potential for drug discovery: Early stage industry dynamics. <i>Drug Discovery Today</i> , 26(7), 1680–1688. <a href="https://doi.org/10.1016/j.drudis.2021.06.003">https://doi.org/10.1016/j.drudis.2021.06.003</a>
<b>Original URL</b>	<a href="https://www.sciencedirect.com/science/article/pii/S1359644621002750">https://www.sciencedirect.com/science/article/pii/S1359644621002750</a>
<b>Source type</b>	Peer-Reviewed Journal Article
<b>Keywords</b>	Quantum computing; Quantum technology; Technology adoption; Pharmaceutical industry; Computational drug design; Drug discovery; Drug development
<b>#Tags</b>	#Quantum Computing Feasability and Usage in the Pharmaceutic Industry
<b>Summary of key points + notes (include methodology)</b>	Currently, the use of quantum computing in the pharmaceutical industry is at a preliminary level with very limited usage. If used optimally quantum computing combined with other existing technologies could greatly increase the speed of the drug development process; however, it is yet to be used in this optimal state. As a result of this untapped potential, pharmaceutical companies along with those companies involved with quantum computing have taken steps to further incorporate the technology into the drug development process.
<b>Research Question/Problem/Need</b>	Can quantum computing realistically improve the process of drug development in the pharmaceutical industry?
<b>Important Figures</b>	17 of the 21 largest pharmaceutical companies have publicly announced that they have/are conducting activities in quantum computing. 16 of these 17 companies have ties with other QC companies or startups.
<b>VOCAB: (w/definition)</b>	Quantum Computing – A type of computing in which bits are simultaneously transmitting ones and zeros. These are called qubits, where can then be assembled into a quantum computer. Noisy Intermediate-Scale Quantum (NISQ) System – This is a type of quantum computers that are currently being used. They make many errors and therefore are not necessarily the optimal system.
<b>Cited references to follow up on</b>	<a href="https://onlinelibrary.wiley.com/doi/full/10.1002/qua.24811">https://onlinelibrary.wiley.com/doi/full/10.1002/qua.24811</a> <a href="https://www.sciencedirect.com/science/article/pii/S016561471930135X">https://www.sciencedirect.com/science/article/pii/S016561471930135X</a>

<b>Follow up Questions</b>	<p>Can combining machine learning and quantum computing from cloud-based systems allow for a much faster process of finding the ideal drug for a disease that does not currently have a cure?</p> <p>How much more financially and time efficient would quantum computing be for pharmaceutical companies than classical computers?</p> <p>Can machine learning be used for the error correction of quantum computers and possibly allow quantum computers to become viable and better alternatives to classical computers in the process of drug development?</p>
----------------------------	--

## Article Number 4: “Quantum Computing Makes Inroads Towards Pharma”

<b>Source Title</b>	“Quantum Computing Makes Inroads Towards Pharma”
<b>Source citation (APA Format)</b>	Choi, C. Q. (2021). Quantum Computing Makes Inroads Towards Pharma. <i>IEEE</i>
<b>Original URL</b>	<a href="https://spectrum.ieee.org/quantum-drug">https://spectrum.ieee.org/quantum-drug</a>
<b>Source type</b>	Peer-Reviewed Journal Article
<b>Keywords</b>	Quantum computing, Pharmaceutical, Drug Development
<b>#Tags</b>	
<b>Summary of key points + notes (include methodology)</b>	<p>This article mainly discusses the possible usage of quantum computers in the pharmaceutical industry and primarily in drug development. It mentions that quantum computers have the ability to perform massive calculations, however, due to certain limitations they can only do calculations involving just a few atoms. This means that quantum computers cannot at the moment even model a molecule as small as caffeine. However, many pharmaceutical giants and quantum computing giants are partnering up to utilize the full potential of this technology. The current benefit of quantum computers is the accuracy of calculations that they provide, not the speed.</p>
<b>Research Question/Problem/Need</b>	Are quantum computers a potentially game-changing technology in the drug development industry?
<b>Important Figures</b>	A quantum computer with 300 qubits would be able to perform more calculations instantaneously than the amount of atoms in the entirety of the visible universe.
<b>VOCAB: (w/definition)</b>	Qubits: The bits of a quantum computer, they can transmit ones and zeros at the same time.

<b>Cited references to follow up on</b>	N/A (Does not have a list of references)
<b>Follow up Questions</b>	<p>Why is better hardware not currently developed?</p> <p>Could quantum computing be used for the creation of a drug for mitochondrial dysfunction?</p> <p>Could quantum computing be combined with AI to improve its speed efficiency when conducting pharmaceutical calculations?</p>

## Article #5: Immunotherapies targeting neoantigens are effective in PD-1 blockade-resistant tumors

<b>Source Title</b>	Immunotherapies targeting neoantigens are effective in PD-1 blockade-resistant tumors
<b>Source citation (APA Format)</b>	Sun C, Nagaoka K, Kobayashi Y, et al. Immunotherapies targeting neoantigens are effective in PD-1 blockade-resistant tumors. <i>Int J Cancer</i> . 2023; 152(7): 1463-1475. doi: <a href="https://doi.org/10.1002/ijc.34382">10.1002/ijc.34382</a>
<b>Original URL</b>	<a href="https://onlinelibrary.wiley.com/doi/epdf/10.1002/ijc.34382">https://onlinelibrary.wiley.com/doi/epdf/10.1002/ijc.34382</a>
<b>Source type</b>	Journal Article
<b>Keywords</b>	adoptive cell transfer, cancer immunotherapy, DC vaccine, PD-1/PD-L1 blockade, tumor, neoantigen
<b>#Tags</b>	
<b>Summary of key points + notes (include methodology)</b>	<p>This research paper aimed to find a whether or not immunotherapies targeting neoantigens are effective in PD-1 blockade-resistant tumors. To do this four different murine cell cultures were used. All of them were kept under different conditions. The DNA of these cell cultures was then carefully cut up, amplified, and analyzed to find indel and frameshift mutations. Then, the cancerous mice tissue was injected into a flank with two different types of cell lines. The tumor growth was then monitored while injecting anti-PD-1 3 times a day and/or anti-CD8a 3 times a day. In another simultaneous experiment, different cells were placed in the presence of dendritic cells to see the effects of a DC vaccine. Based on the results, anti-PD-1 Tx was insufficient for controlling ASB-XIV as only 2 out of the 8 tumors regressed in size. However, the DC vaccine monotherapy induced T-cell responses which suppressed ASB-XIV tumor growth. The combination of the DC vaccination and anti-PD-1 treatment was also shown to be effective in reducing tumor sizes in YTN16 tumors, which were PD-1 blockade resistant. PD-1 blockade was not effective on reducing the tumor sizes of ASB-XIV and YTN16. DC</p>

	<p>vaccination is a very promising method that is effective at targeting neoantigens.</p> <ul style="list-style-type: none"> <li>• Uses murine models</li> <li>• Uses ASB-XIV</li> <li>• Uses YTN16</li> <li>• Uses 4TC</li> <li>• Uses RENCA</li> <li>• Uses CT26</li> <li>• Uses BALB/c and C57BL/6N mice</li> <li>• Uses a combination of a dendritic cell vaccine and anti-PD-1 Tx</li> </ul>
<p><b>Research Question/Problem/Need</b></p>	<p>The research question of this work was, what is the effectiveness of combining anti-PD-1 therapy (Tx) with a neoantigen vaccine if they are both used against PD-1/L1 blockade-resistant tumors in murine models?</p>
<p><b>Important Figures</b></p>	
<p><b>VOCAB: (w/definition)</b></p>	<p>Lymphocyte-Type of white blood cell  PD-1: Type of protein that keeps immune response/cells in check  CD8<sup>+</sup>T cells: T cells that are toxic/harmful to cancer cells and can kill them  Neoepitope: The targeted part of the cancer cell for T cells. Allow immune cells to target cancer.  ASB-XIV cell-line: BALB/c mouse lung carcinoma cell line.  In silico: Done in computer simulation  Prophylactic: Preventing the spread of disease  Anti-tumor immunity: An immune response against a tumor.  Streptomycin: A antibiotic that treats bacterial infections.  Penicillin: A class of antibiotics used to treat bacterial infections such as strep throat, ear infections, and urinary tract infections.  CT26-Murine colorectal carcinoma cell line, it comes from a BALB/c mouse.  YTN16 cell line: A transplantable cell line from the gastric cancer of C57BL/6.  Fetal Bovine Serum (FBS): A natural serum which is made from the blood of a cow fetus and supports the growth of cell cultures.  MITO+ Serum Extender: A substance used to grow cell cultures in conditions no serum or reduced levels of serum.  RPMI 1640 Medium: This substance was intended to culture human leukemic cells in suspension (as a monolayer). It has also now been found to be suitable for many different mammalian cells.  RENCA: A mouse renal adenocarcinoma cell line that is from a spontaneous renal cortical adenocarcinoma in BALB/c mice.  MEM nonessential amino acids solution: A supplement for cell culture growth.  Extra sodium pyruvate: A salt of pyruvic acid that is used to provide energy to cell cultures for their growth.  Mycoplasma: A bacteria which can infect different parts of the body.  Anti-PD 1: A cancer immunotherapy that allows T cells to kill tumor cells as the binding of PD-L1 to PD-1 is blocked using an immune checkpoint inhibitor (This could be anti-PD-L1 or anti-PD-1).  Monoclonal antibody: An antibody produced in a lab to bind to certain targets in</p>

	<p>the body, including antigens on surface of cancer cells.</p> <p>Inoculate: Immunize</p>

## Article #7 Notes: Neoantigens in cancer immunotherapy

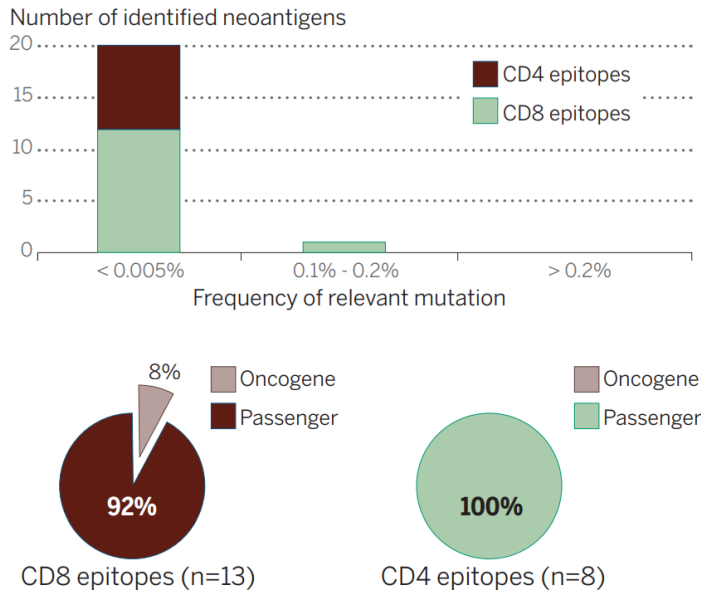

Article notes should be on separate sheets

### KEEP THIS BLANK AND USE AS A TEMPLATE

Source Title	<i>Neoantigens in cancer immunotherapy</i>
Source citation (APA Format)	Schumacher, T. N., & Schreiber, R. D. (2015). Neoantigens in cancer immunotherapy. <i>Science</i> , 348(6230), 69–74. <a href="https://doi.org/10.1126/science.aaa4971">https://doi.org/10.1126/science.aaa4971</a>
Original URL	<a href="https://www.science.org/doi/10.1126/science.aaa4971?url_ver=Z39.88-2003&amp;rfr_id=ori:rid:crossref.org&amp;rfr_dat=cr_pub%20%20pubmed">https://www.science.org/doi/10.1126/science.aaa4971?url_ver=Z39.88-2003&amp;rfr_id=ori:rid:crossref.org&amp;rfr_dat=cr_pub%20%20pubmed</a>
Source type	Peer-Reviewed Journal Article
Keywords	Cancer, Neoantigens, Immunotherapy, T cell

#Tags	
<p><b>Summary of key points + notes (include methodology)</b></p>	<p>This is a journal article, so the methodology consists of using data from other articles. How the articles are gathered is not mentioned in the text. There are a few very important findings that the paper mentions, which I did not know about before this. These are listed below and are the main benefit of reading this paper.</p> <ul style="list-style-type: none"> <li>• CD8 cells can only target MHC class 1 cells</li> <li>• CD4 cells can only target MHC class 2 cells</li> <li>• All of the exons combined are called the exome.</li> <li>• This article also analyzed the frequency of neoantigens in different cancers. These frequencies can differ by 100,000%.</li> <li>• In the neoantigens that were gathered from different studies, only epitopes targeted by CD8 cells had a chance of being oncogenes, while all of the genes targeted by CD4 epitopes were passenger genes.</li> <li>• The article also identifies the three different methods by which neoantigens can be targeted.</li> </ul>
<p><b>Research Question/Problem/Need</b></p>	<p>What is the role of neoantigens in cancer immunotherapy?</p>
<p><b>Important Figures</b></p>	<p><b>Fig. 2. Estimate of the neoantigen repertoire in human cancer.</b> Data depict the number of somatic mutations in individual tumors. Categories on the right indicate current estimates of the likelihood of neoantigen formation in different tumor types. Adapted from (50). It is possible that the immune system in melanoma patients picks up on only a fraction of the available neoantigen repertoire, in which case the current analysis will be an underestimate. A value of 10 somatic mutations per Mb of coding DNA corresponds to ~150 nonsynonymous mutations within expressed genes.</p>

### Mutation-derived neoantigens in human cancer

**Fig. 3. Characteristics of melanoma neoantigens.** (Top) For a group of CD4+ T cell neoantigens (8 epitopes) and CD8+ T cell neoantigens (13 epitopes) identified by cancer exome-based screens, the frequency of mutation of that residue in a cohort of ~20,000 human tumor samples (51) is depicted. (Bottom) For the same group of CD4+ T cell and CD8+ T cell neoantigens, the fraction of encoding mutations that occurs within known oncogenes (52) is depicted.

**Fig. 4. Strategies to target the patient-specific neoantigen repertoire.** (A) Immunotherapy is given in combination with interventions such as radiotherapy that enhance exposure to autologous neoantigens. (B) Potential neoantigens are identified as in Fig. 1 steps 1 to 3, a patient-specific vaccine is produced, and this vaccine is given together with adjuvant and T cell checkpoint-blocking antibodies. (C) Potential neoantigens are identified as in Fig. 1 steps 1 to 3. T cells that are specific for these neoantigens are induced or expanded in vitro, and the resulting T cell product is given together with T cell checkpoint-blocking antibodies.

**VOCAB: (w/definition)**

Endogenous T cells - Naturally occurring T cells that are reactive to tumors  
 CD8 – Only binds to MHC class 1

	CD4 – Only binds to MHC class 2 Oncogenes – Genes that play a role in the development of cancer tumors
<b>Cited references to follow up on</b>	<ol style="list-style-type: none"><li>1. <a href="https://www.science.org/doi/10.1126/science.1203486">https://www.science.org/doi/10.1126/science.1203486</a></li><li>2. <a href="https://www.nejm.org/doi/full/10.1056/NEJMoa1003466">https://www.nejm.org/doi/full/10.1056/NEJMoa1003466</a></li></ol>
<b>Follow up Questions</b>	Could a vaccine be used in combination with an expansion of neoantigen specific T cells? Could checkpoint blockade be used in combination with any type of vaccine, including viral vectors?

## Article #8: Distinct cellular dynamics associated with response to CAR-T therapy for refractory B cell lymphoma

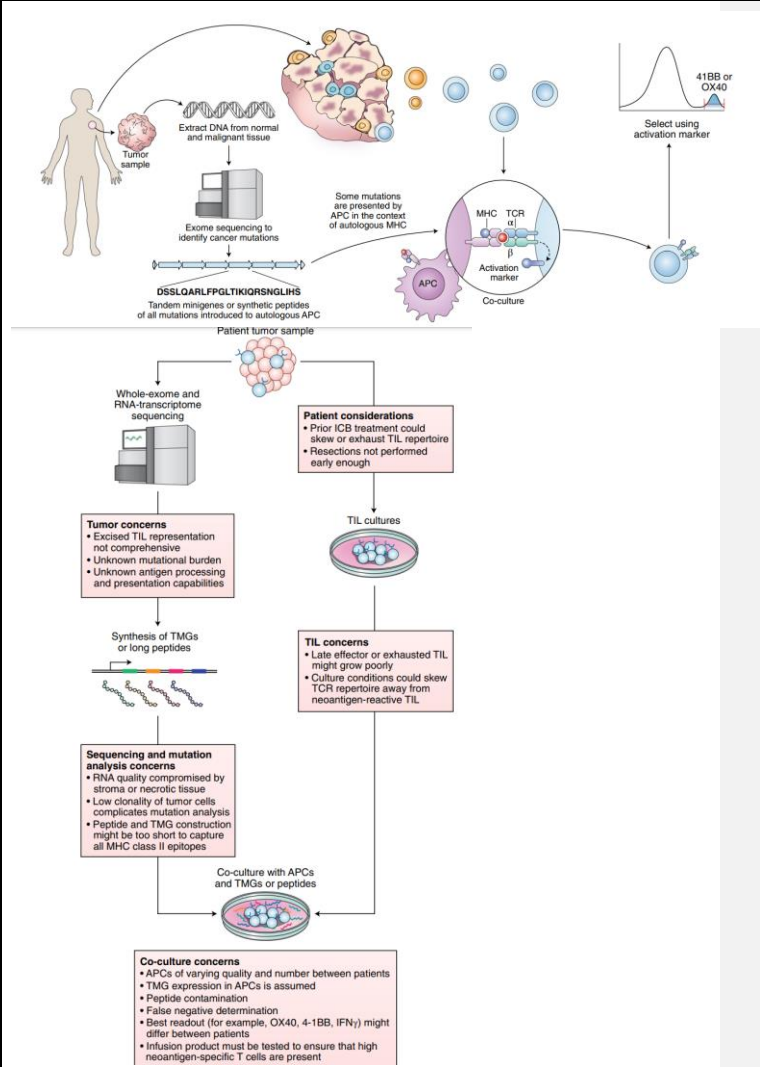

<b>Source Title</b>	Distinct cellular dynamics associated with response to CAR-T therapy for refractory B cell lymphoma
<b>Source citation (APA Format)</b>	Haradhvala, N.J., Leick, M.B., Maurer, K. <i>et al.</i> Distinct cellular dynamics associated with response to CAR-T therapy for refractory B cell lymphoma. <i>Nat Med</i> <b>28</b> , 1848–1859 (2022). <a href="https://doi.org/10.1038/s41591-022-01959-0">https://doi.org/10.1038/s41591-022-01959-0</a>
<b>Original URL</b>	<a href="https://www.nature.com/articles/s41591-022-01959-0">https://www.nature.com/articles/s41591-022-01959-0</a>
<b>Source type</b>	Peer-Reviewed Journal Article
<b>Keywords</b>	DLBCL, tisa-cel, axi-cel, CD8 T cells
<b>#Tags</b>	
<b>Summary of key points + notes (include methodology)</b>	<p>This study was measuring the immune response elicited in patients with DLBCL. They used both a tisa-cell response and an axi-cel response. Both were measured through the amount of CD8 T cells present. For the study monocyte cells were used as DLBCL forms in the blood.</p> <ul style="list-style-type: none"> <li>• Tisa cels increased the memory of CD8 T cells</li> <li>• Axi cells may be what causes the relapse in treatment as T cells are associated with not responding to this sort of treatment</li> <li>• The tisa cel treatment also significantly decreased the amount of CD8 T<sub>reg</sub> cells <ul style="list-style-type: none"> <li>○ This means that there would also be a greater immune response since these cells actually disrupt the work of the actual immune system T cells.</li> </ul> </li> <li>• It was also determined that cryopreservation may limit CD8 T<sub>reg</sub> cells as the tisa-cel was frozen while the axi-cel was not</li> </ul>
<b>Research Question/Problem/Need</b>	Why do does CAR-T cell therapy not work for around half of the patients with refractory DLBCL?
<b>Important Figures</b>	
<b>VOCAB: (w/definition)</b>	DLBCL – A type of fast growing lymphoma Monocyte – A type of white blood cell Hematology – Study of the physiology of the blood PET scan – Detects metabolically active malignant lesions

<b>Cited references to follow up on</b>	<ol style="list-style-type: none"><li>1. <a href="https://www.neim.org/doi/10.1056/NEJMoa1407222">https://www.neim.org/doi/10.1056/NEJMoa1407222</a></li><li>2. <a href="https://www.nejm.org/doi/10.1056/NEJMoa1708566">https://www.nejm.org/doi/10.1056/NEJMoa1708566</a></li></ol>
<b>Follow up Questions</b>	<ul style="list-style-type: none"><li>• Since the tisa-cel approach allowed for a much larger response, could this method possibly be used in combination with other methods?</li><li>• Could using the tisa-cel approach and axi-cel approach combined elicit an even greater immune response from the t-cells?</li><li>• Could this treatment strategy be used in other cancers?</li></ul>

## Article #9: Developing neoantigen-targeted T cell–based treatments for solid tumors

<b>Source Title</b>	Developing neoantigen-targeted T cell–based treatments for solid tumors
<b>Source citation (APA Format)</b>	Yamamoto, T. N., Kishton, R. J., & Restifo, N. P. (2019). Developing neoantigen-targeted T cell–based treatments for solid tumors. <i>Nature Medicine</i> , 25(10), 1488–1499. <a href="https://doi.org/10.1038/s41591-019-0596-y">https://doi.org/10.1038/s41591-019-0596-y</a>
<b>Original URL</b>	<a href="https://www-nature-com.ezpv7-web-p-u01.wpi.edu/articles/s41591-019-0596-y">https://www-nature-com.ezpv7-web-p-u01.wpi.edu/articles/s41591-019-0596-y</a>
<b>Source type</b>	Peer-Reviewed Journal Article (Review Article)
<b>Keywords</b>	ACT, Lymphocytes, T cells, Neoantigen, Tumor, Cancer
<b>#Tags</b>	
<b>Summary of key points + notes (include methodology)</b>	<p>This is a review article, which means that the methodology was finding the information/data. How this was done is not mentioned. However, the paper provides major data that could be important in determining which method may be the best for this project:</p> <ul style="list-style-type: none"> <li>• ACT using TIL (Tumor infiltrating Lymphocytes) for patients with advanced melanoma showed response rates of tumor regression as high as 54%</li> <li>• Only 3000 genes encode proteins that are expressed on the cell surface of mammalian cells and only some of these are expressed in a given cancer. This limits the use of CAR-based therapies although they are still effective. CAR-based therapies can only recognize neoantigens on the cell surfaces.</li> <li>• DC vaccines currently in development only show 3.3% of patients treated having an objective regression.</li> <li>• The T cells used in ACT should be tumor specific although, they do not have to be</li> <li>• TIL is the best source for T cells to be applied in ACT due to them being tumor specific</li> <li>• It is possible to identify tumor specific T cells in the bloodstream but it is much harder.</li> </ul>
<b>Research Question/Problem/Need</b>	What are the effective T cell-based treatments for solid tumors?

Important Figures

**VOCAB: (w/definition)**

ACT – Adoptive cell transfer, which means that patients are treated with personalized anti-tumor T cells  
 ICB – Immune checkpoint blockade, which stimulates an immune response against PD-1 or CTLA-4 which are the inhibitors of the immune response.

<b>Source type</b>	Peer-Reviewed Journal Article
<b>Keywords</b>	dendritic cell, pancreatic cancer, mutation burden, immunotherapy, cancer vaccines, neoantigen
<b>#Tags</b>	
<b>Summary of key points + notes (include methodology)</b>	This was a review paper so the methodology involved gathering data and information. <ul style="list-style-type: none"> <li>• PDAC is 55% of pancreatic cancers</li> <li>• The NEO-PV-01 vaccine is effective in combination with PD-1 blockage</li> <li>• iNeo-Vac-P01 enhances the clinical efficacy of PCs <ul style="list-style-type: none"> <li>○ Neoantigen based vaccine</li> </ul> </li> <li>• Most DC vaccines focus on TAAs</li> <li>• Among a neoantigen pulsed DC vaccine about 75% showed disease inhibition and 25% responded to vaccination</li> </ul>
<b>Research Question/Problem/Need</b>	What is the effectiveness of a dendritic cell vaccine for pancreatic cancer and how does it work?
<b>Important Figures</b>	
<b>VOCAB: (w/definition)</b>	Therapeutic Vaccination – A vaccine for a disease that has already occurred. PDAC - Pancreatic ductal adenocarcinoma, which is a very fast-growing tumor
<b>Cited references to follow up on</b>	<a href="https://molecular-cancer.biomedcentral.com/articles/10.1186/s12943-019-1055-6">https://molecular-cancer.biomedcentral.com/articles/10.1186/s12943-019-1055-6</a> <a href="https://www.nature.com/articles/s41586-018-0792-9">https://www.nature.com/articles/s41586-018-0792-9</a>
<b>Follow up Questions</b>	Can many of the different types of vaccines be combined into one therapy? Is regular vaccination more effective than therapeutic vaccination?

What are the downsides of therapeutic vaccination?

## Patent 1: COMPOSITION AND VACCINE FOR TREATING LUNG CANCER

<b>Source Title</b>	COMPOSITION AND VACCINE FOR TREATING LUNG CANCER
<b>Source citation (APA Format)</b>	Fotin-Mleczek, M., Gnad-Vogt, U., & Kallen, K.-J. (2021). <i>Composition and vaccine for treating lung cancer</i> (Patent No. AU2019226125B2). Australia Trade and Patent Office. <a href="https://patents.google.com/patent/AU2019226125B2/en?q=(cancer+vaccine)&amp;oq=cancer+vaccine">https://patents.google.com/patent/AU2019226125B2/en?q=(cancer+vaccine)&amp;oq=cancer+vaccine</a>
<b>Original URL</b>	<a href="https://patents.google.com/patent/AU2019226125B2/en?q=(cancer+vaccine)&amp;oq=cancer+vaccine">https://patents.google.com/patent/AU2019226125B2/en?q=(cancer+vaccine)&amp;oq=cancer+vaccine</a>
<b>Source type</b>	Patent
<b>Keywords</b>	Cancer, antigen, mRNA
<b>#Tags</b>	
<b>Summary of key points + notes (include methodology)</b>	The patent first describes the background into lung cancer and different treatments available to cancer currently. These include chemotherapy, radiotherapy, and more. These have been shown to improve life expectancy. It then summarizes the invention. The invention is the discovery of six antigens that could be used for a cancer vaccine. These antigens are 5T4, Survivin, NY-ESO-1, MAGE-C1, MAGE-C2, and MUC1. These are potential targets for immunotherapies. Each of these antigens have their own properties. At least one mRNA must code for a combination of these antigens for it to function as an appropriate target.
<b>Research Question/Problem/Need</b>	The research need is the composition of a vaccine for lung cancer.
<b>Important Figures</b>	
<b>VOCAB: (w/definition)</b>	Innate Immune System – It is the defense system which someone is born with and it is not specific or adaptive.
<b>Cited references to follow up on</b>	<ul style="list-style-type: none"> <li><a href="https://patents.google.com/patent/WO2009046974A2/en?q=(cancer+vaccine)&amp;oq=cancer+vaccine">https://patents.google.com/patent/WO2009046974A2/en?q=(cancer+vaccine)&amp;oq=cancer+vaccine</a></li> <li><a href="https://patents.google.com/patent/GB2484058A/en?q=(cancer+vaccine)&amp;oq=cancer+vaccine">https://patents.google.com/patent/GB2484058A/en?q=(cancer+vaccine)&amp;oq=cancer+vaccine</a></li> </ul>
<b>Follow up Questions</b>	Is there a specific vaccine mechanism that would be required to target these genes? Do these six genes interact with other transcription factors that could possibly cause cancer?

Could these genes be mutated and injected through a personalized process for each person?

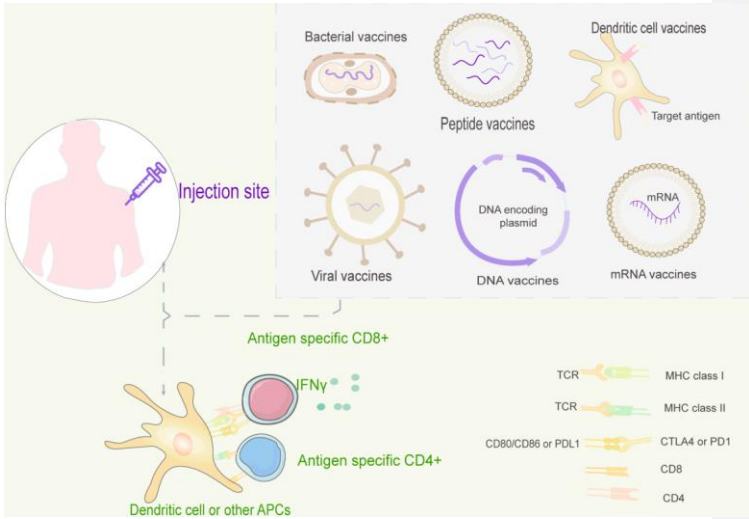

## Patent #2: Prostate cancer DNA vaccine

<b>Source Title</b>	Prostate cancer DNA vaccine
<b>Source citation (APA Format)</b>	Groettrup, M., & Oehlschlaeger, P. (2012). <i>Prostate cancer DNA vaccine</i> (Patent No. GB2484058A). U.K. Patent and Trade Office. <a href="https://patents.google.com/patent/GB2484058A/en?q=(cancer+vaccine)&amp;oq=cancer+vaccine">https://patents.google.com/patent/GB2484058A/en?q=(cancer+vaccine)&amp;oq=cancer+vaccine</a>
<b>Original URL</b>	<a href="https://patents.google.com/patent/GB2484058A/en?q=(cancer+vaccine)&amp;oq=cancer+vaccine">https://patents.google.com/patent/GB2484058A/en?q=(cancer+vaccine)&amp;oq=cancer+vaccine</a>
<b>Source type</b>	Patent
<b>Keywords</b>	Prostate, cancer, DNA, vaccine, immunotherapy, treatment
<b>#Tags</b>	
<b>Summary of key points + notes (include methodology)</b>	<p>There are currently a few methods to treat prostate cancer. These are mainly the traditional methods of surgery or radiotherapy. However, these methods are not effective enough as one third of the patients develop progressive or metastatic disease within 10 years. In the United States 29,000 people die of prostate cancer each year. The vaccine in this patent is an artificial prostate-acid-phosphatase (PAP)-based DNA vaccine.</p> <ul style="list-style-type: none"> <li>• The vaccine will at least decrease the growth of the cancer tumor</li> <li>• The DNA injected activates T cells in the blood</li> <li>• The vaccine targets the PAP antigen <ul style="list-style-type: none"> <li>○ PAP is highly expressed in prostate tissue, making it easier to target</li> </ul> </li> <li>• This vaccine can be used to prevent prostate cancer and to treat it</li> <li>•</li> </ul>
<b>Research Question/Problem/Need</b>	What is the effectiveness of a DNA vaccine for prostate cancer?
<b>Important Figures</b>	
<b>VOCAB: (w/definition)</b>	Large T antigen – A protein from SV40 Kozak Sequence – It is the protein translation initiation site
<b>Cited references to follow up on</b>	<ul style="list-style-type: none"> <li>• <a href="https://journals.lww.com/cmi/fulltext/2007/03020/enhancement_of_dna_vaccine_induced_immune.12.aspx">https://journals.lww.com/cmi/fulltext/2007/03020/enhancement_of_dna_vaccine_induced_immune.12.aspx</a></li> <li>• <a href="https://faseb.onlinelibrary.wiley.com/doi/epdf/10.1096/fj.01-0993fje">https://faseb.onlinelibrary.wiley.com/doi/epdf/10.1096/fj.01-0993fje</a></li> </ul>
<b>Follow up Questions</b>	Could this vaccine be implemented in RNA if the bases were swapped to accommodate for this change?

	<p>Could this vaccine be made personalized by extracting DNA from each individual person?</p> <p>Could this vaccine be used in combination with anti PD-1 or CAR4 T cell therapy?</p>
--	---

## Article #11: Unlocking Immunity: Innovative prostate cancer vaccine strategies

<b>Source Title</b>	Unlocking Immunity: Innovative prostate cancer vaccine strategies
<b>Source citation (APA Format)</b>	Gu, Qiannan., Qi, Anning., Wang, Ne., Zhou, Zhenxian., & Zhou, Xiaohui. (2024). Unlocking Immunity: Innovative prostate cancer vaccine strategies. <i>International Immunopharmacology</i> , 142, 113137. <a href="https://doi.org/10.1016/j.intimp.2024.113137">https://doi.org/10.1016/j.intimp.2024.113137</a>
<b>Original URL</b>	<a href="https://www.sciencedirect-com.ezpv7-web-p-u01.wpi.edu/science/article/pii/S1567576924016588">https://www.sciencedirect-com.ezpv7-web-p-u01.wpi.edu/science/article/pii/S1567576924016588</a>

<p><b>Follow up Questions</b></p>	<p>Why are bacterial vaccines so rarely used?          Can dendritic cells and viral be combined to create one vaccine?          Could there be multiple ways to use each of these vaccines?</p>

## Article #12: Advances in the development of personalized neoantigen-based therapeutic cancer vaccines

<b>Source Title</b>	Advances in the development of personalized neoantigen-based therapeutic cancer vaccines
<b>Source citation (APA Format)</b>	Blass, E., & Ott, P. A. (2021). Advances in the development of personalized neoantigen-based therapeutic cancer vaccines. <i>Nature Reviews Clinical Oncology</i> , 18(4), 215–229. <a href="https://doi.org/10.1038/s41571-020-00460-2">https://doi.org/10.1038/s41571-020-00460-2</a>
<b>Original URL</b>	<a href="https://www.nature.com/articles/s41571-020-00460-2">https://www.nature.com/articles/s41571-020-00460-2</a>
<b>Source type</b>	Peer-Reviewed Journal Article
<b>Keywords</b>	Personalized Cancer Vaccine, Neoantigen, Immunotherapy, Immune Response, T cells
<b>#Tags</b>	
<b>Summary of key points + notes (include methodology)</b>	<p>It is a review article, so it gathers data from different studies. The article explains how neoantigens are the proper targets for such an immunotherapy. They are only on cancer cells and therefore, the immunotherapy will not target regular cells. Tumor infiltrating CD8 T cells can recognize neoantigens</p> <ul style="list-style-type: none"> <li>• Personalize cancer vaccines have been proved to be effective and safe in patients with melanoma and glioblastomas</li> <li>• Immunoediting can lead to tumor outgrowth, which is a concern for vaccines <ul style="list-style-type: none"> <li>○ This is because with less tumor cells there will be less neoantigens and therefore tumors will be able to grow</li> </ul> </li> <li>• APC Cells could be potential candidates for neoantigens</li> </ul>

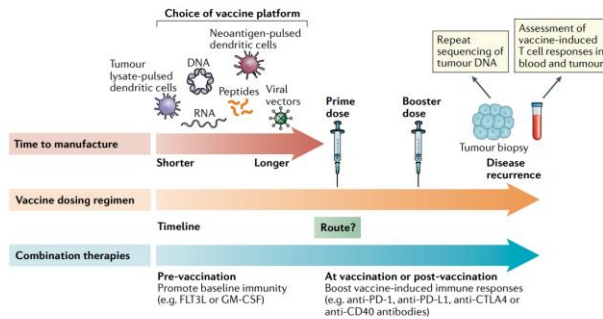

- There are 5 key trials regarding cancer vaccines at the moment, which are shown in important figures
- CD8 T cell exhaustion is also a major concern as it can lead to relapse in immunotherapies

**Research Question/Problem/Need**

What are the new advances in recent years of personalized neoantigen-based therapeutic cancer vaccines?

**Important Figures**

Trial	Phase	Tumour type	Vaccine format	Key contributions	Ref.
NCT00683670	I	Advanced-stage melanoma	Dendritic cell	Provided proof of concept that neoantigen vaccines can induce T cell responses	37
NeoVax (NCT01970358)	I/Ib	Resected high-risk stage III/IV melanoma	Peptide	Demonstrated that neoantigen peptide-based vaccines can induce CD4 <sup>+</sup> T cell and CD8 <sup>+</sup> T cell responses and can be combined with ICIs	35
IVAC MUTANOME (NCT02035956)	I	NY-ESO-1-positive and/or tyrosinase-positive stage III or IV melanoma	mRNA	Demonstrated that mRNA vaccines incorporating TAAs and neoantigens can induce CD4 <sup>+</sup> T cell and CD8 <sup>+</sup> T cell responses and can be combined with ICIs	36
NeoVax (NCT02287428)	I/Ib	MGMT promoter-unmethylated glioblastoma	Peptide	Demonstrated that neoantigen vaccines can induce CD4 <sup>+</sup> T cell and CD8 <sup>+</sup> T cell responses in immunologically cold tumours with low mutational burdens	30
GAPVAC (NCT02149225)	I	Glioblastoma	Peptide	Demonstrated that peptide vaccines incorporating TAAs and neoantigens can induce CD4 <sup>+</sup> T cell and CD8 <sup>+</sup> T cell responses in immunologically cold tumours with low mutational burdens	9

**Fig. 3 | Considerations relating to therapeutic neoantigen vaccine regimens.** Various factors should be considered during the design of therapeutic vaccination regimens. Following sample collection, the time required to generate the personalized vaccine is a crucial factor, particularly in the metastatic disease setting. The manufacturing time is dependent on the choice of vaccine platform, as indicated for the various platforms listed along the red arrow. However, while the personalized vaccine is being designed and manufactured, combination therapies can be administered to the patient with the aim of fostering a favourable immunological milieu. Adjuvant therapies can also be given either at the time of or following vaccination to enhance the immune response. Additional variables include the route of administration of the vaccine and any combination therapies, as well as the number of booster vaccinations. In the case of disease recurrence, tumour DNA sequencing can be repeated (for example, to understand why the vaccine was ineffective for long-term tumour control and/or to identify potential alternative neoantigens), and vaccine-induced T cell responses can be evaluated using both blood and tumour samples to inform decisions regarding subsequent therapy. FLT3L, Fms-related tyrosine kinase 3 ligand; GM-CSF, granulocyte-macrophage colony-stimulating factor.

<b>#Tags</b>	
<b>Summary of key points + notes (include methodology)</b>	<p>This article is a review article, and it explains the different effects of combination therapy with a cancer vaccine. All of the different combinations definitely have appeal and potential. Their details are listed below.</p> <ul style="list-style-type: none"> <li>• Radiation is an immunomodulator, not an immunosuppressor, according to recent studies</li> <li>• This means that radiation in fact, could stimulate the immune system if paired with a vaccine. This is mainly because when a tumor cell dies due to radiation, it releases TAAs. These TAA's can be targeted using a vaccine to then elicit an immune response in a similar way to neoantigens. However, the issue with this is that TAAs are also released by normal cells, which could put them at risk in a similar manner to regular radiation therapy or chemotherapy.</li> <li>• Radiation therapy is also able to alter the cell-surface expression of a variety of immunomodulatory molecules including Fas, ICAM-1, MHC-I, and TAAs such as carcinoembryonic antigen (CEA) and mucin-1 (MUC-1). Out of such 23 molecules, 21 or 91% of them increased in frequency in human carcinoma cell lines.</li> <li>• Most research until rather recently suggested that the pairing of</li> </ul>

	<p>chemotherapy and a cancer vaccine would negatively impact the antitumor immune response. However, recent studies suggest that, in a similar manner to radiation therapy, chemotherapeutic agents can also be immunomodulatory. These agents can in a similar way to radiation therapy, alter the expression of TAAs, MHC-I, ICAM-1, and APM.</p> <ul style="list-style-type: none"> <li>• The article also goes into specifics regarding chemotherapeutic agents, however, they have a rather similar response to being paired with a cancer vaccine.</li> <li>• (Small Molecule Inhibitors) SMIs can modulate specific cell pathways and are less toxic for humans than chemotherapy. These can inhibit immune suppressor cells. An example of such treatment would be anti-PD1 treatment. This can be a very effective combination if the timing of the two different treatments is effectively placed.</li> </ul>
<b>Research Question/Problem/Need</b>	What are the effects of using combination therapy through a cancer vaccine and a standard cancer treatment?

<b>Summary of key points + notes (include methodology)</b>	<p>The vaccine used in this clinical trials was an E75 vaccine. It targets HER2/neu which is a protooncogene. Overexpression of it is found in 20 to 25% of breast cancer which leads to a bad prognosis. E75 has also been used in previous clinical trials. Still, the clinical efficacy of E75 is largely unknown, which is why clinical trials like this are continuing to be conducted. This was conducted at Walter Reed Army Medical Center and Joyce Murtha Breast Care Center. It is considered an investigational new drug application.</p> <ul style="list-style-type: none"> <li>• Patients <ul style="list-style-type: none"> <li>○ All had previously completed the standard course of: <ul style="list-style-type: none"> <li>▪ Surgery</li> <li>▪ Chemotherapy</li> <li>▪ Radiation therapy</li> </ul> </li> <li>○ Some of the patients were also HLA-A3+ patients</li> </ul> </li> <li>• Trial Methodology <ul style="list-style-type: none"> <li>○ 3-6 patients each assigned to receive four or six monthly injections</li> </ul> </li> </ul>

	<ul style="list-style-type: none"> <li>o of 100, 500, or 1,000 micrograms of the vaccine</li> <li>o The patients were questioned about toxicity levels about 48-72 hours after administering the doses</li> <li>o Blood was drawn at each vaccination             <ul style="list-style-type: none"> <li>▪ Lymphocytes were extracted from this to examine</li> </ul> </li> <li>o 186 patients were in the trial in total</li> </ul>

**Fig. 2. A,** vaccine-induced E75-specific CTL for all patients. The median level CD8<sup>+</sup> E75-specific CTL were significantly increased from prevaccination level (0.39%; range, 0-3.28%) to a maximum level (1.8%; range, 0.4-12.2%;  $P < 0.001$ ) and postvaccination level (0.70%; range, 0.06-2.91%;  $P = 0.002$ ). There was no difference between prevaccine levels and long-term (6 mo) levels of specific T cells. **B,** vaccine-induced E75-specific CTL based on preexisting immunity. Patients with and without preexisting immunity showed identical patterns in response to E75 vaccination with similar median maximum and postvaccination levels achieved for both. However, in those patients without preexisting immunity, there was a significant increase in dimer levels from prevaccine to 6 mo postvaccine 0.13% (range, 0-0.28%) versus 0.45% (0-2.68%);  $P < 0.0001$ .

**Fig. 4.** Kaplan-Meier disease-free survival curves at 20 mo median follow-up. For 171 enrolled patients, the recurrence rate in the vaccinated group was 5.6% compared with 14.2% in the observation group ( $P = 0.04$ ) at a median follow-up of 20 mo. The disease-free survival rates in the vaccinated and control groups were 92.5% and 77%, respectively.

<b>#Tags</b>	
<b>Summary of key points + notes</b>	Rather than the conventional negative geotaxis tests, this article decided to use a

<p><b>(include methodology)</b></p>	<p>new method in which the negative geotaxis assay will be conducted on each individual fly rather than as a group. This was done using laser sensor technology. In this study adult drosophila flies were used. The flies were also anesthetized using CO2 before the assay was conducted. A general locomotion assay was also conducted in this article.</p> <ul style="list-style-type: none"> <li>• The general locomotion assay was showed to not measure depression effectively</li> <li>• The forced-climbing test was effective at measuring depression</li> </ul>
<p><b>Research Question/Problem/Need</b></p>	<p>Is a new type of negative geotaxis assay more effective than a conventional negative geotaxis assay?</p>
<p><b>Important Figures</b></p>	<p>The figure is divided into several panels:         <ul style="list-style-type: none"> <li><b>A:</b> Experimental workflow. It shows the process from eclosion to L-Dopa treatment (5 days) and testing (2 days). Testing includes forced climbing, activity behavior, and qPCR. A legend indicates Control (blue) and L-Dopa (green).</li> <li><b>B:</b> Forced Climbing results for Males. A line graph shows 'Moves / sec' over a 6-hour session. The L-Dopa group (green) shows a significant decrease in movement compared to the Control group (blue). <math>p = 0.026</math>.</li> <li><b>C:</b> Forced Climbing results for Females. A line graph shows 'Moves / sec' over a 6-hour session. The L-Dopa group (green) shows a significant decrease in movement compared to the Control group (blue). <math>p = 0.0001</math>.</li> <li><b>D:</b> Gene expression results for Males. Dot plots show 'Fold change' for CG4269 and CG6821. CG4269 shows a significant increase in the L-Dopa group (<math>p = 0.0004</math>), while CG6821 shows no significant change (<math>p = 0.483</math>).</li> <li><b>E:</b> Gene expression results for Females. Dot plots show 'Fold change' for CG4269 and CG6821. CG4269 shows a significant increase in the L-Dopa group (<math>p = 0.006</math>), while CG6821 shows a significant decrease (<math>p = 0.0001</math>).</li> </ul> </p>

An automated rapid iterative negative geotaxis assay for analyzing adult climbing behavior in a <i>Drosophila</i> model of neurodegeneration. <i>J. Vis. Exp.</i> 12:56507.</p>

**Follow up Questions**

Could a forced swim test also measure depression?

Is a negative geotaxis assay that is conventional still effective?

Are there any other disorders which these assays could reveal in drosophila?

**Commented [3]:** Questions are crucial in leading you towards the next paper. This is a MANDATORY section and should include AT LEAST 3 Questions that stem from reading the paper.

## Article #18 Notes: Host DNA contents in fecal metagenomics as a biomarker for intestinal diseases and effective treatment

<b>Keywords</b>	Gut Microbiota, DNA Sequencing, Stool, Probiotics, Depression
<b>#Tags</b>	
<b>Summary of key points + notes (include methodology)</b>	<p>This study used the Hamilton scale for measuring depression. In this study patients were recruited in Switzerland. From these patients some were not considered as part of the data due to certain circumstances, which set them apart from the normal population (i.e. pregnancy, addiction, bipolar disorder). However, all patients were experiencing depression episodes when recruited. ANOVA was used to analyze the results of the study.</p> <ul style="list-style-type: none"> <li>• Study Procedure</li> <li>• Two groups <ul style="list-style-type: none"> <li>○ Control</li> <li>○ Probiotic treatment group</li> </ul> </li> <li>• Both groups were treated throughout 4 weeks (31 days)</li> <li>• Brain imaging was done before the study to determine depression levels of the patients</li> <li>• A follow up assessment was also completed by the patients at the end of the 31 days however, this did not involve brain imaging</li> <li>• In order to assess gut microbiota, feces samples were taking from each participant and stored until DNA extraction.</li> <li>• DNA was extracted using a protocol from (Faloney et. al)</li> </ul>
<b>Research Question/Problem/Need</b>	How does the addition of prebiotics in treating depression affect the gut microbiota?

<b>Important Figures</b>
