

This Lecture will be recorded!!!

Welcome to **CS 3516:** *Computer Networks*

Prof. Yanhua Li

Time: 9:00am –9:50am M, T, R, and F
Zoom Lecture
Fall 2020 A-term

Chapter 3 outline

3.1 transport-layer
services

3.2 multiplexing and
demultiplexing

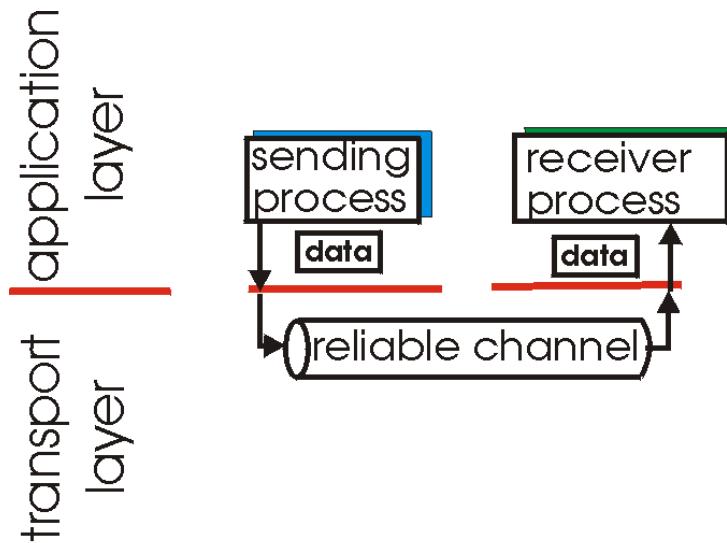

3.3 connectionless
transport: UDP

3.4 principles of reliable
data transfer

3.5 connection-oriented
transport: TCP

Principles of reliable data transfer

- important in application, transport, link layers
 - top-10 list of important networking topics!

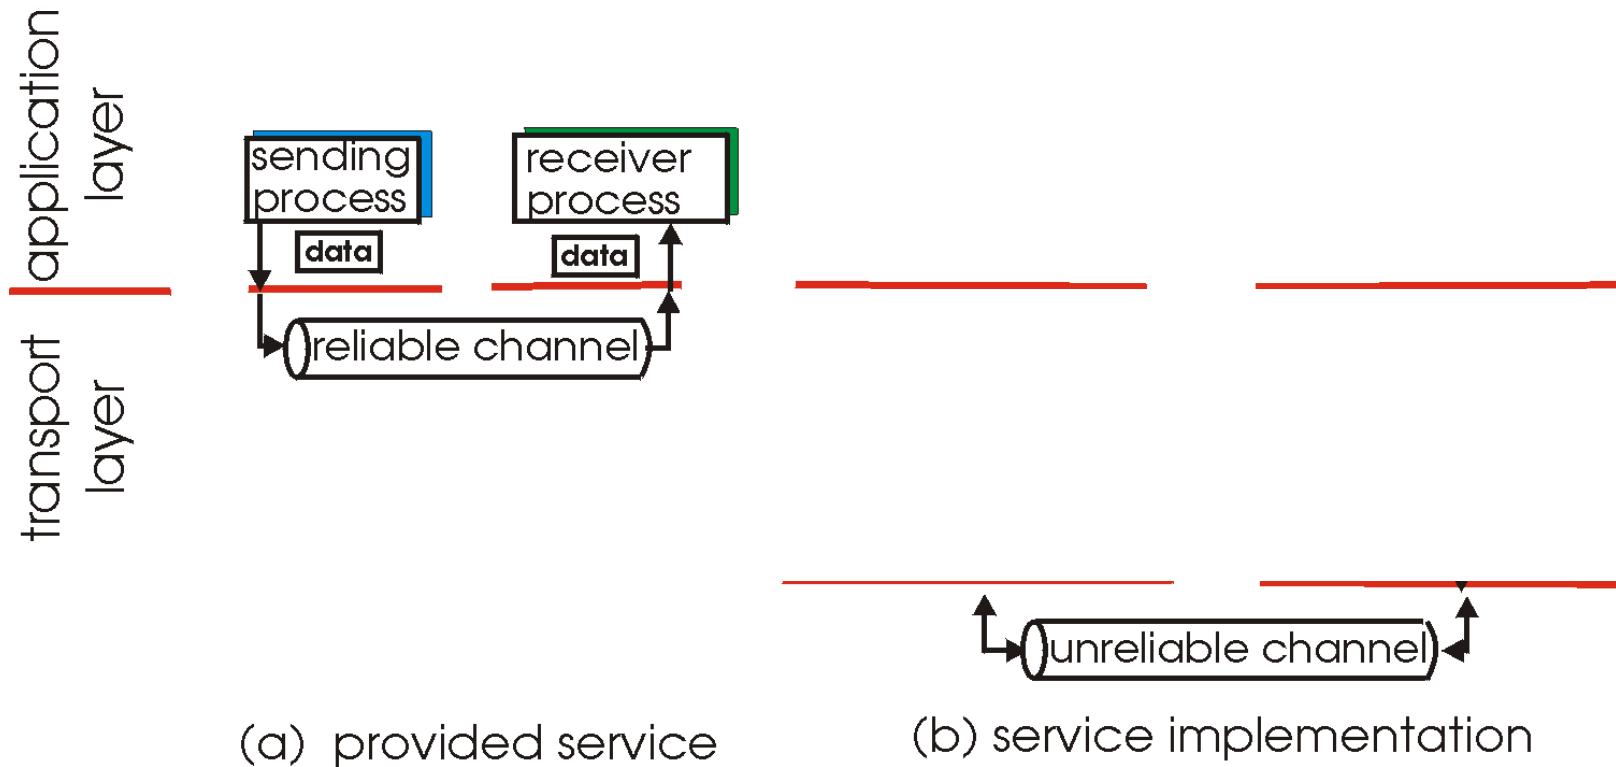

(a) provided service

- characteristics of unreliable channel will determine complexity of reliable data transfer protocol (rdt)

Principles of reliable data transfer

- characteristics of unreliable channel will determine complexity of reliable data transfer protocol (rdt)

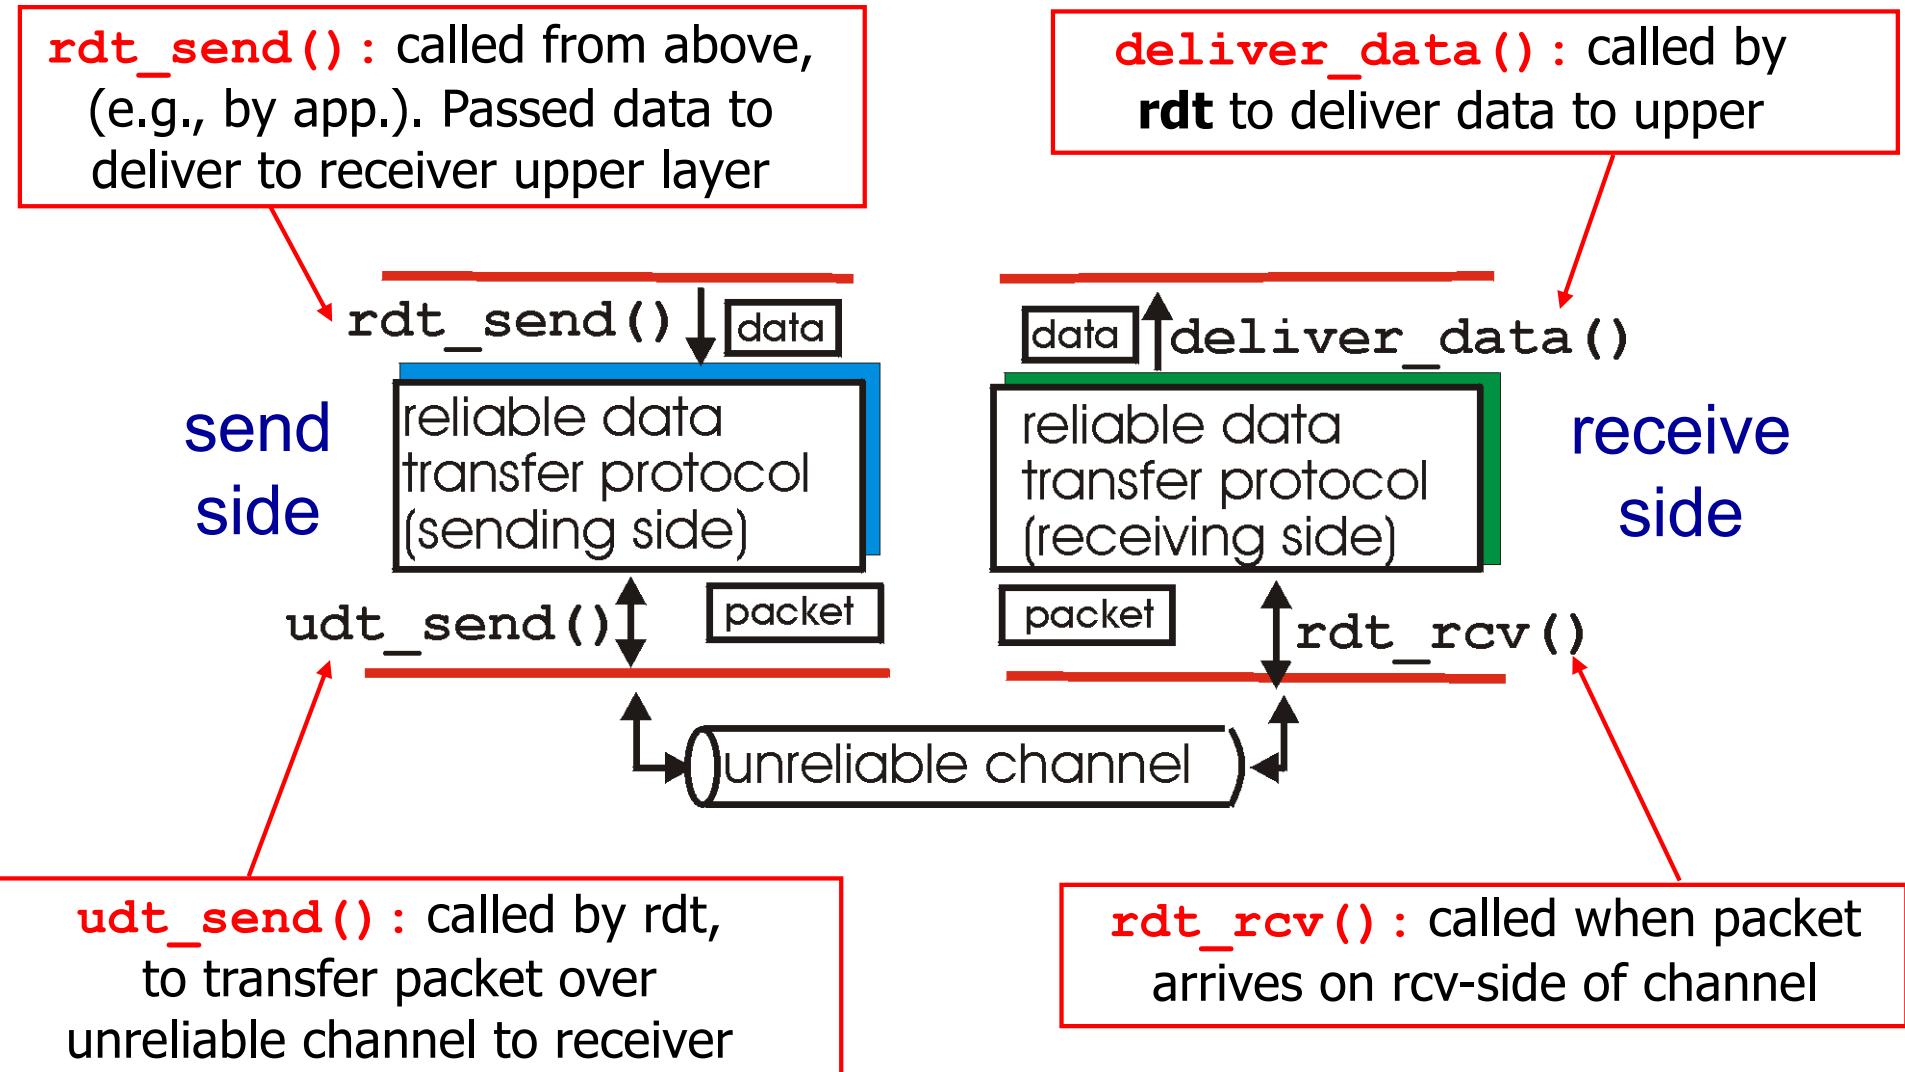

Principles of reliable data transfer

- important in application, transport, link layers
 - top-10 list of important networking topics!

- characteristics of unreliable channel will determine complexity of reliable data transfer protocol (rdt)

Reliable data transfer: getting started

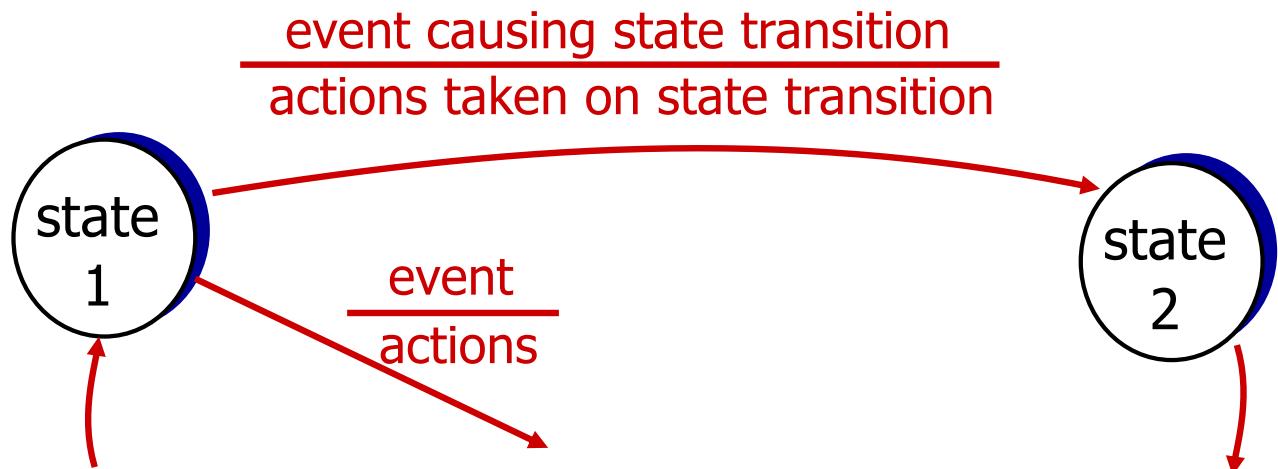

Reliable data transfer: getting started

we'll:

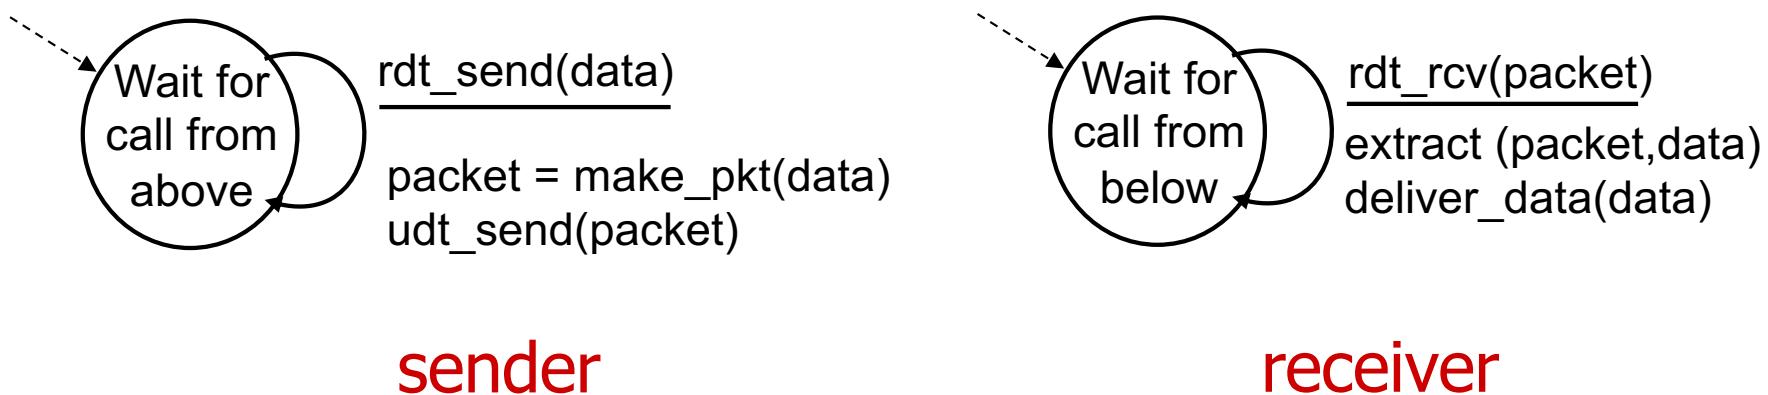

- incrementally develop sender, receiver sides of reliable data transfer protocol (rdt)
- consider only **unidirectional** data transfer
 - but control info will flow on both directions!
- use finite state machines (FSM) to specify sender, receiver

state: when in this “state” next state uniquely determined by next event

rdt 1.0: reliable transfer over a reliable channel

- underlying channel perfectly reliable
 - no bit errors
 - no loss of packets
- separate FSMs for sender, receiver:
 - sender sends data into underlying channel
 - receiver reads data from underlying channel

rdt2.0: channel with bit errors

- underlying channel may flip bits in packet
 - checksum to detect bit errors
- *the question: how to recover from errors:*

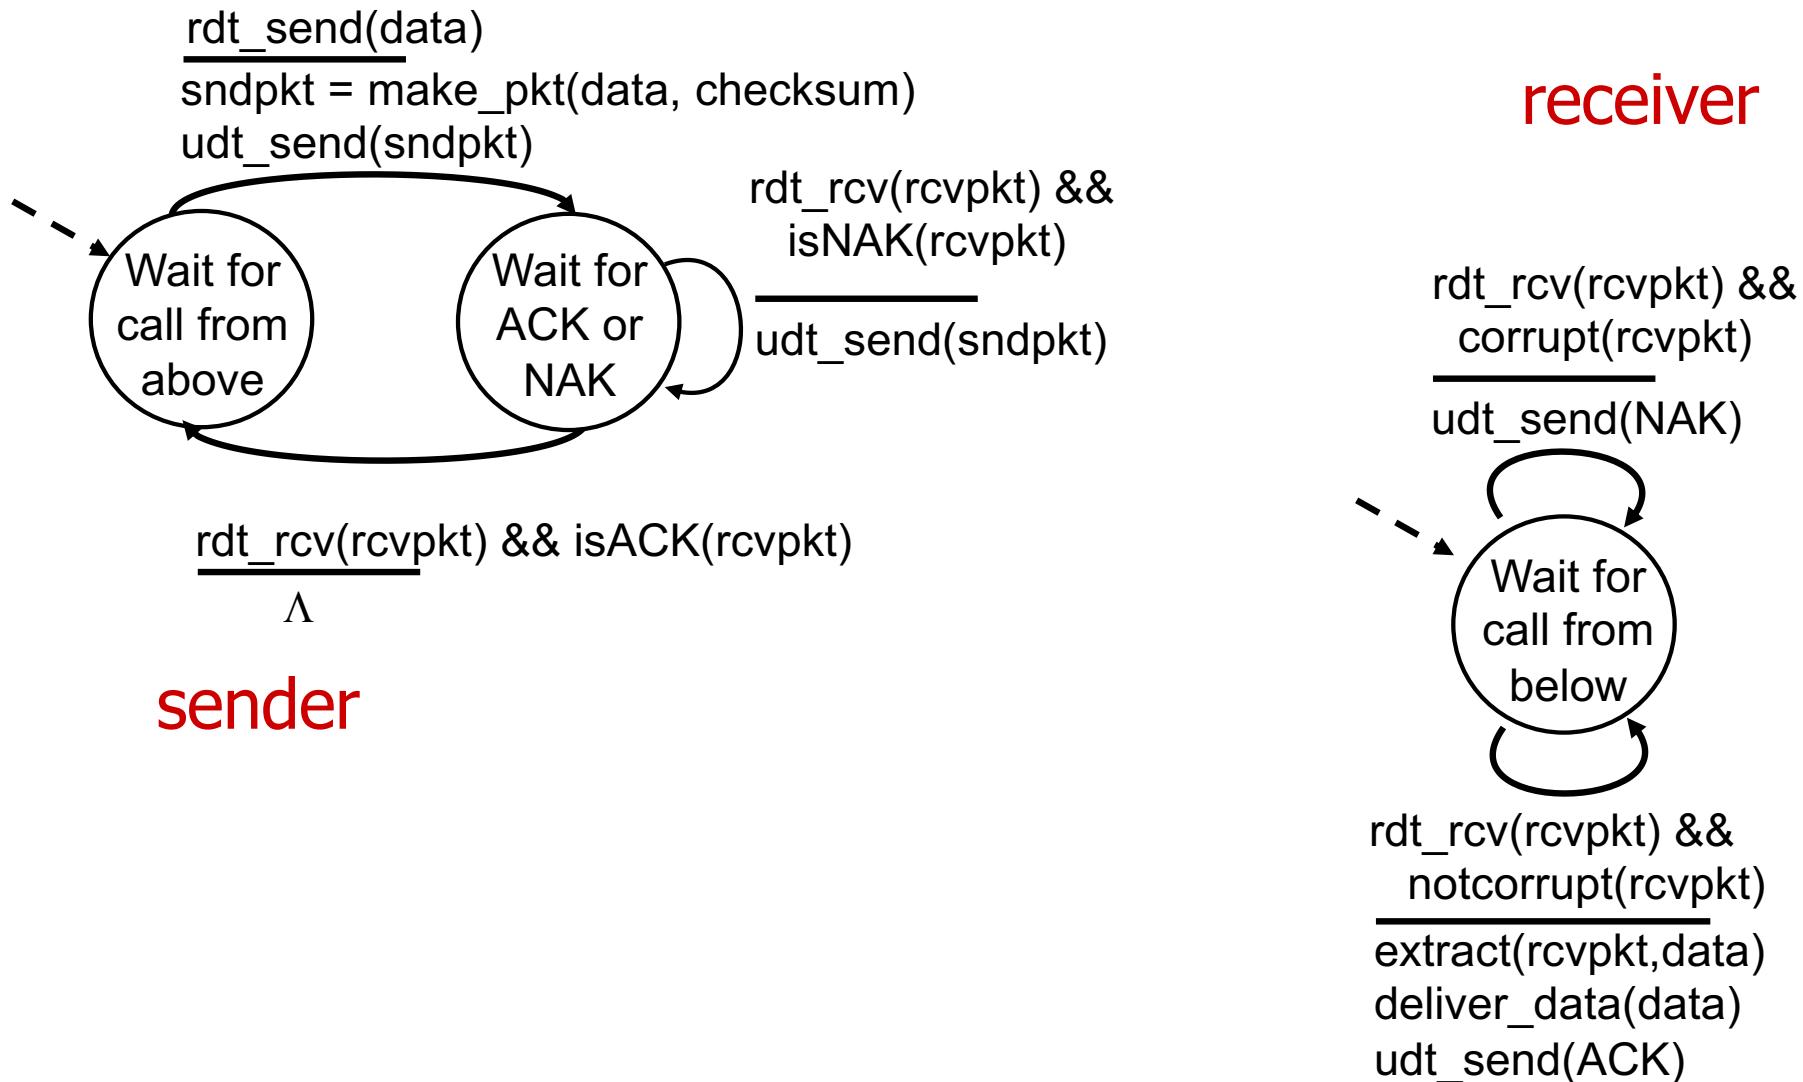

*How do humans recover from “errors”
during conversation?*

rdt2.0: channel with bit errors

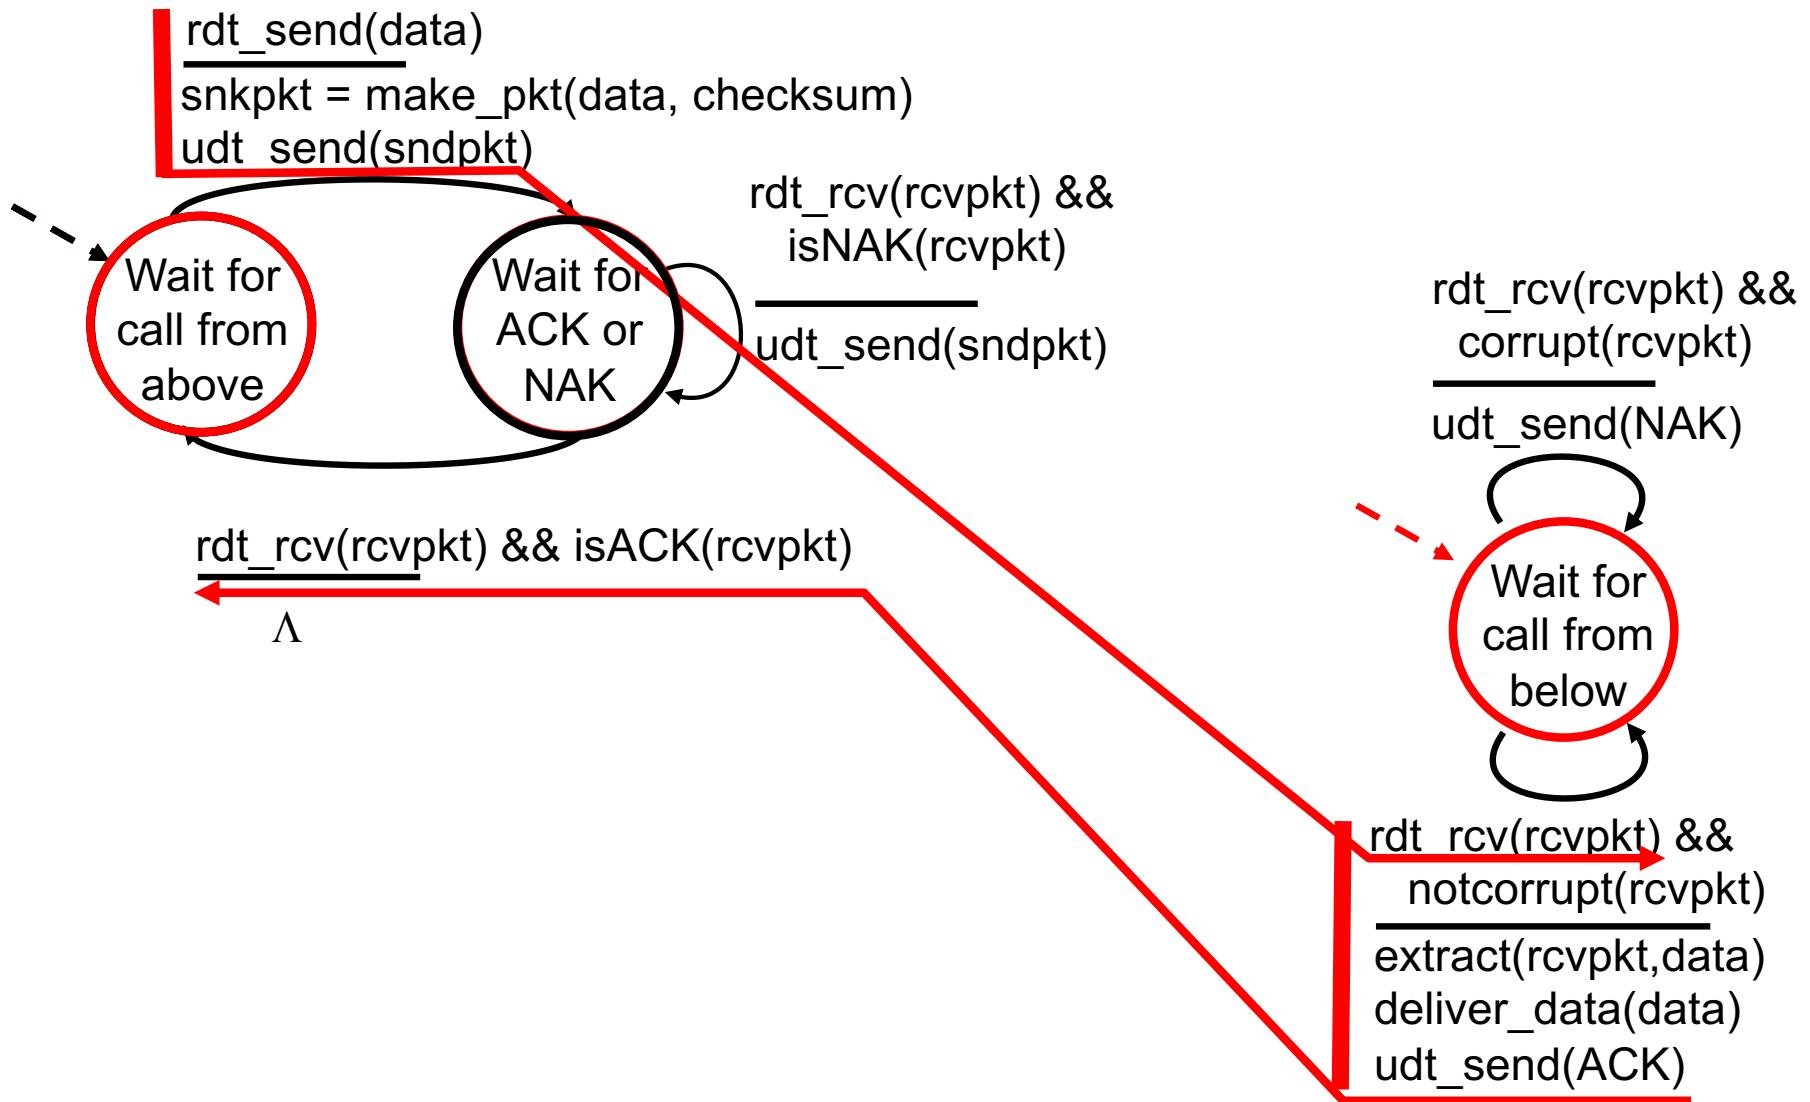

- underlying channel may flip bits in packet
 - checksum to detect bit errors
- *the question: how to recover from errors:*
 - **acknowledgements (ACKs):** receiver explicitly tells sender that pkt received OK
 - **negative acknowledgements (NAKs):** receiver explicitly tells sender that pkt had errors
 - sender retransmits pkt on receipt of NAK
- new mechanisms in `rdt2.0` (beyond `rdt1.0`):
 - **error detection**
 - **feedback:** control msgs (ACK,NAK) from receiver to sender

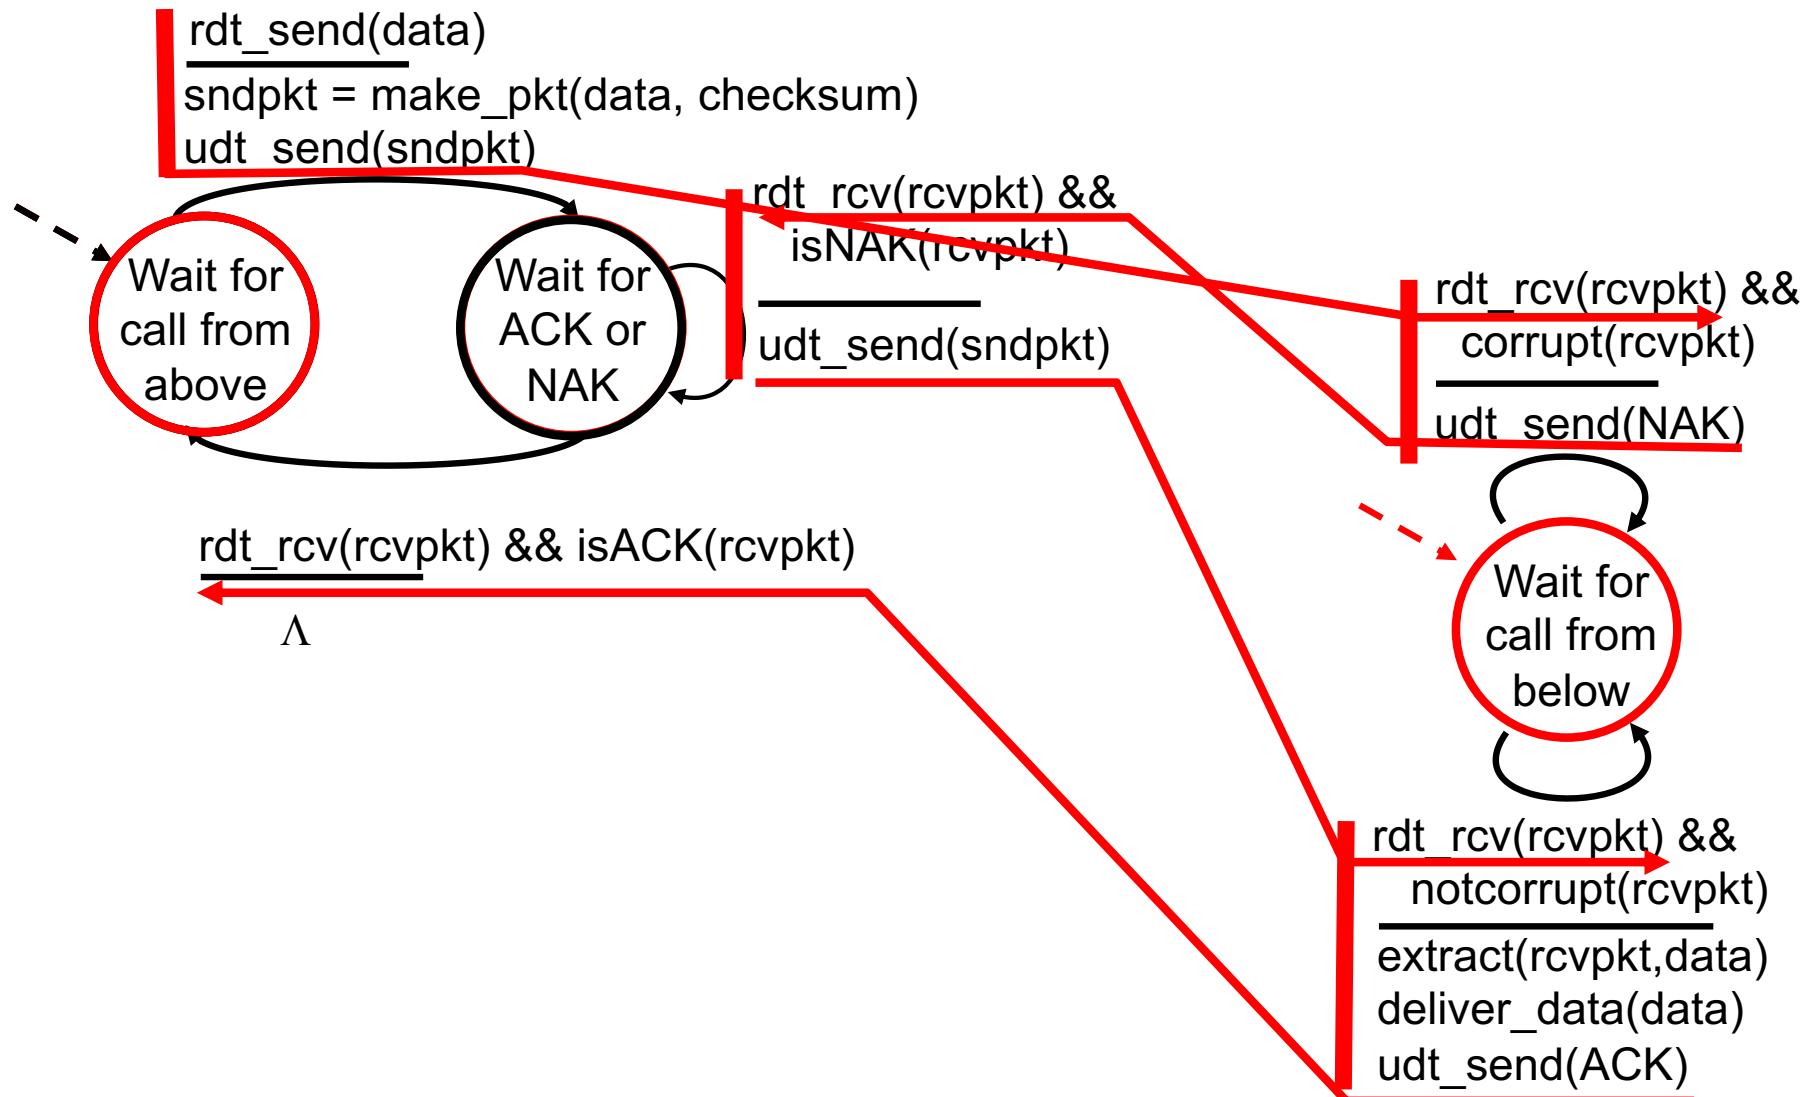

rdt2.0: FSM specification

rdt2.0: operation with no errors

rdt2.0: error scenario

rdt2.0 has a fatal flaw!

what happens if ACK/NAK corrupted?

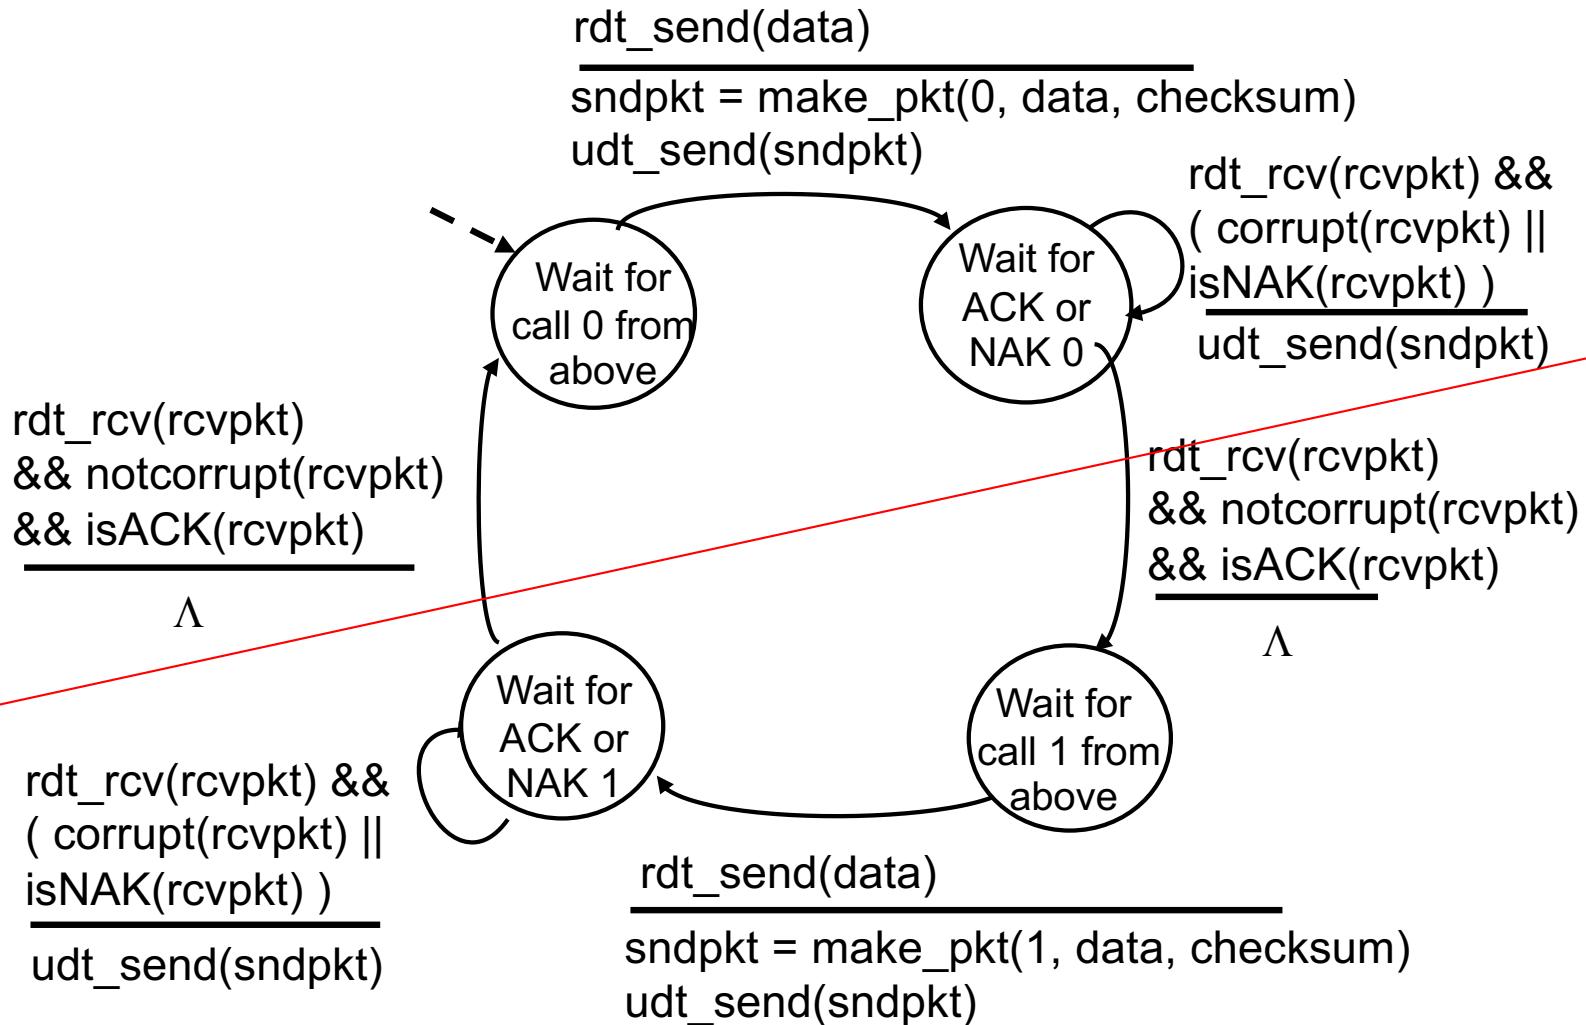

- sender doesn't know what happened at receiver!
- 1. Keep NAKs back and forth.
- 2. Enough checksum to recover
- 3. Retransmit
 - can't just retransmit: possible duplicate

handling duplicates:

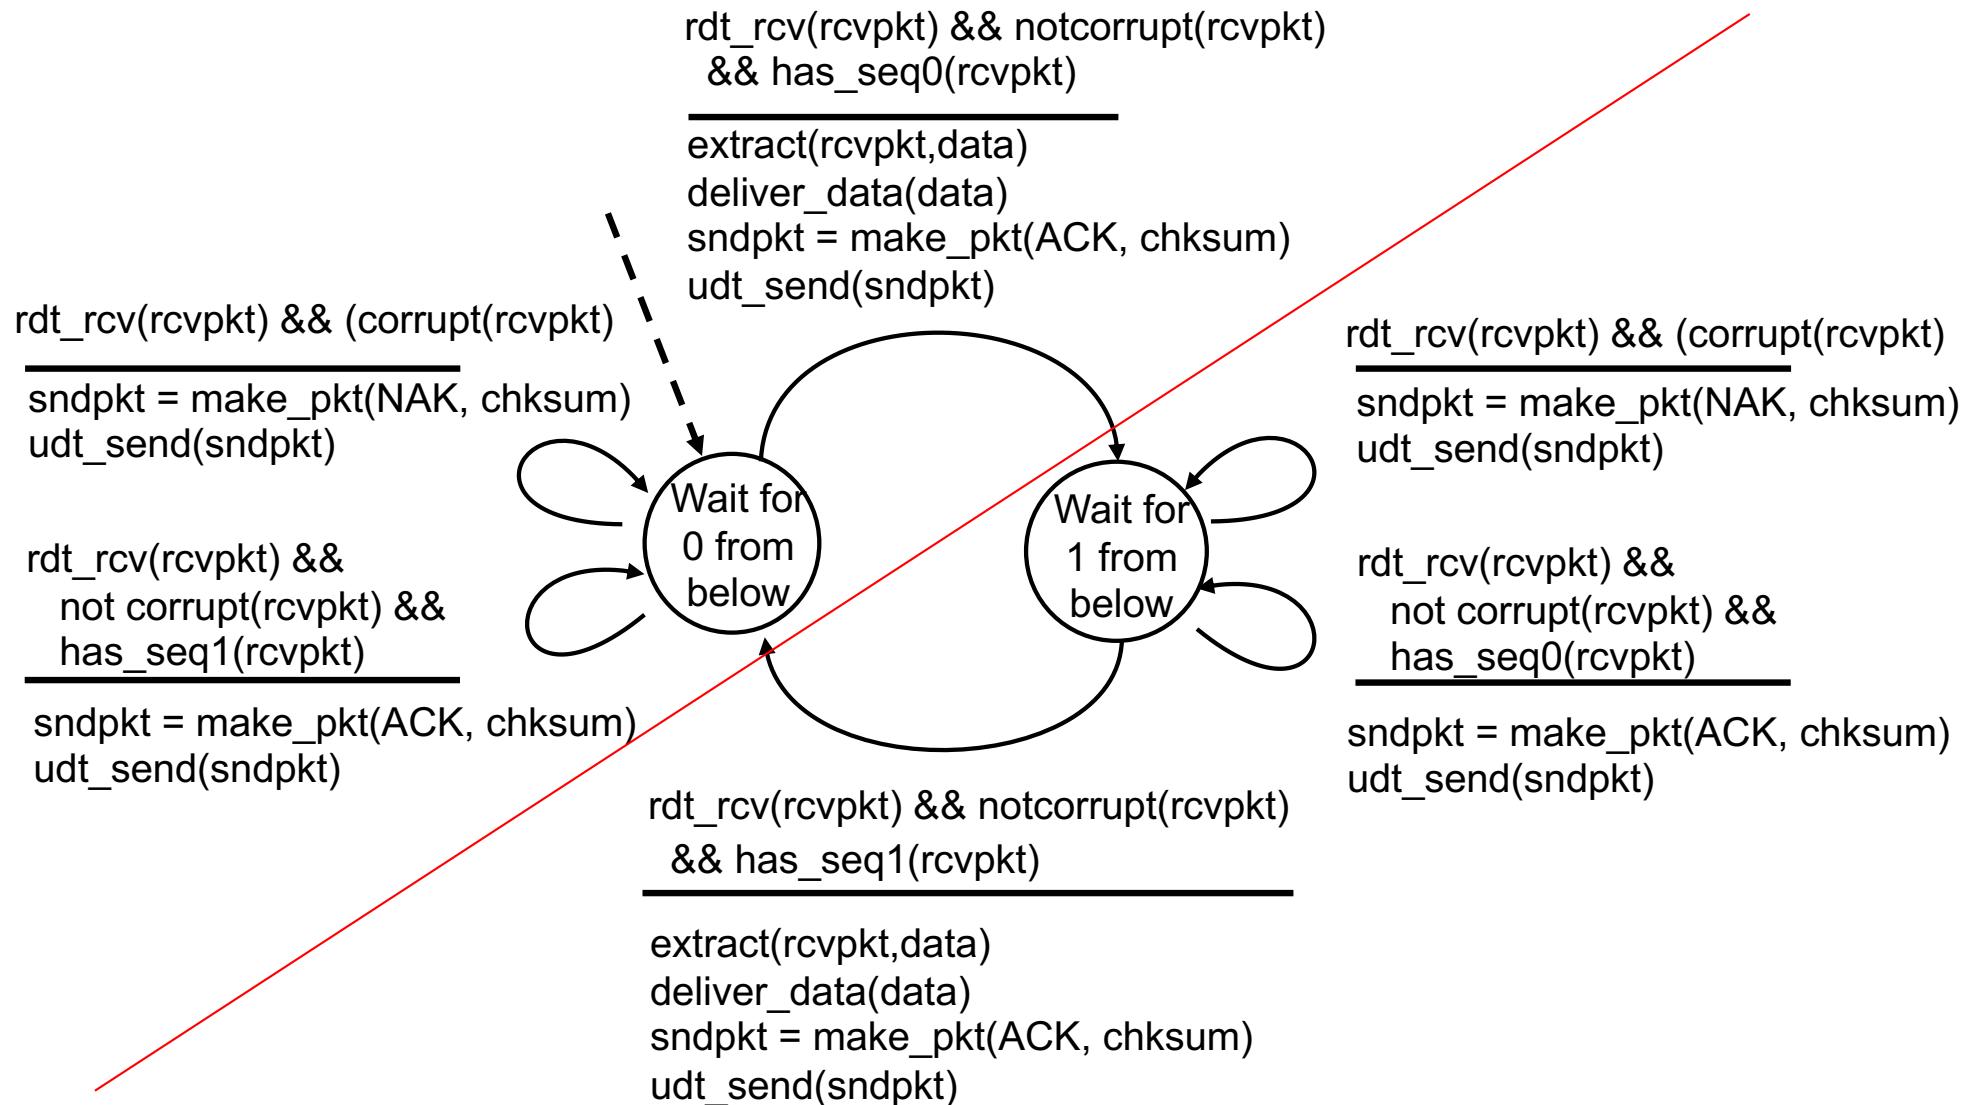

- sender retransmits current pkt if ACK/NAK corrupted
- sender adds *sequence number* to each pkt
- receiver discards (doesn't deliver up) duplicate pkt

stop and wait
sender sends one packet,
then waits for receiver
response

rdt2.1: sender, handles garbled ACK/NAKs

rdt2.1: receiver, handles garbled ACK/NAKs

rdt2.1: discussion

sender:

- seq # added to pkt
- two seq. #'s (0,1) will suffice. **Why?**
- must check if received ACK/NAK corrupted
- twice as many states
 - state must “remember” whether “current” pkt should have seq # of 0 or 1

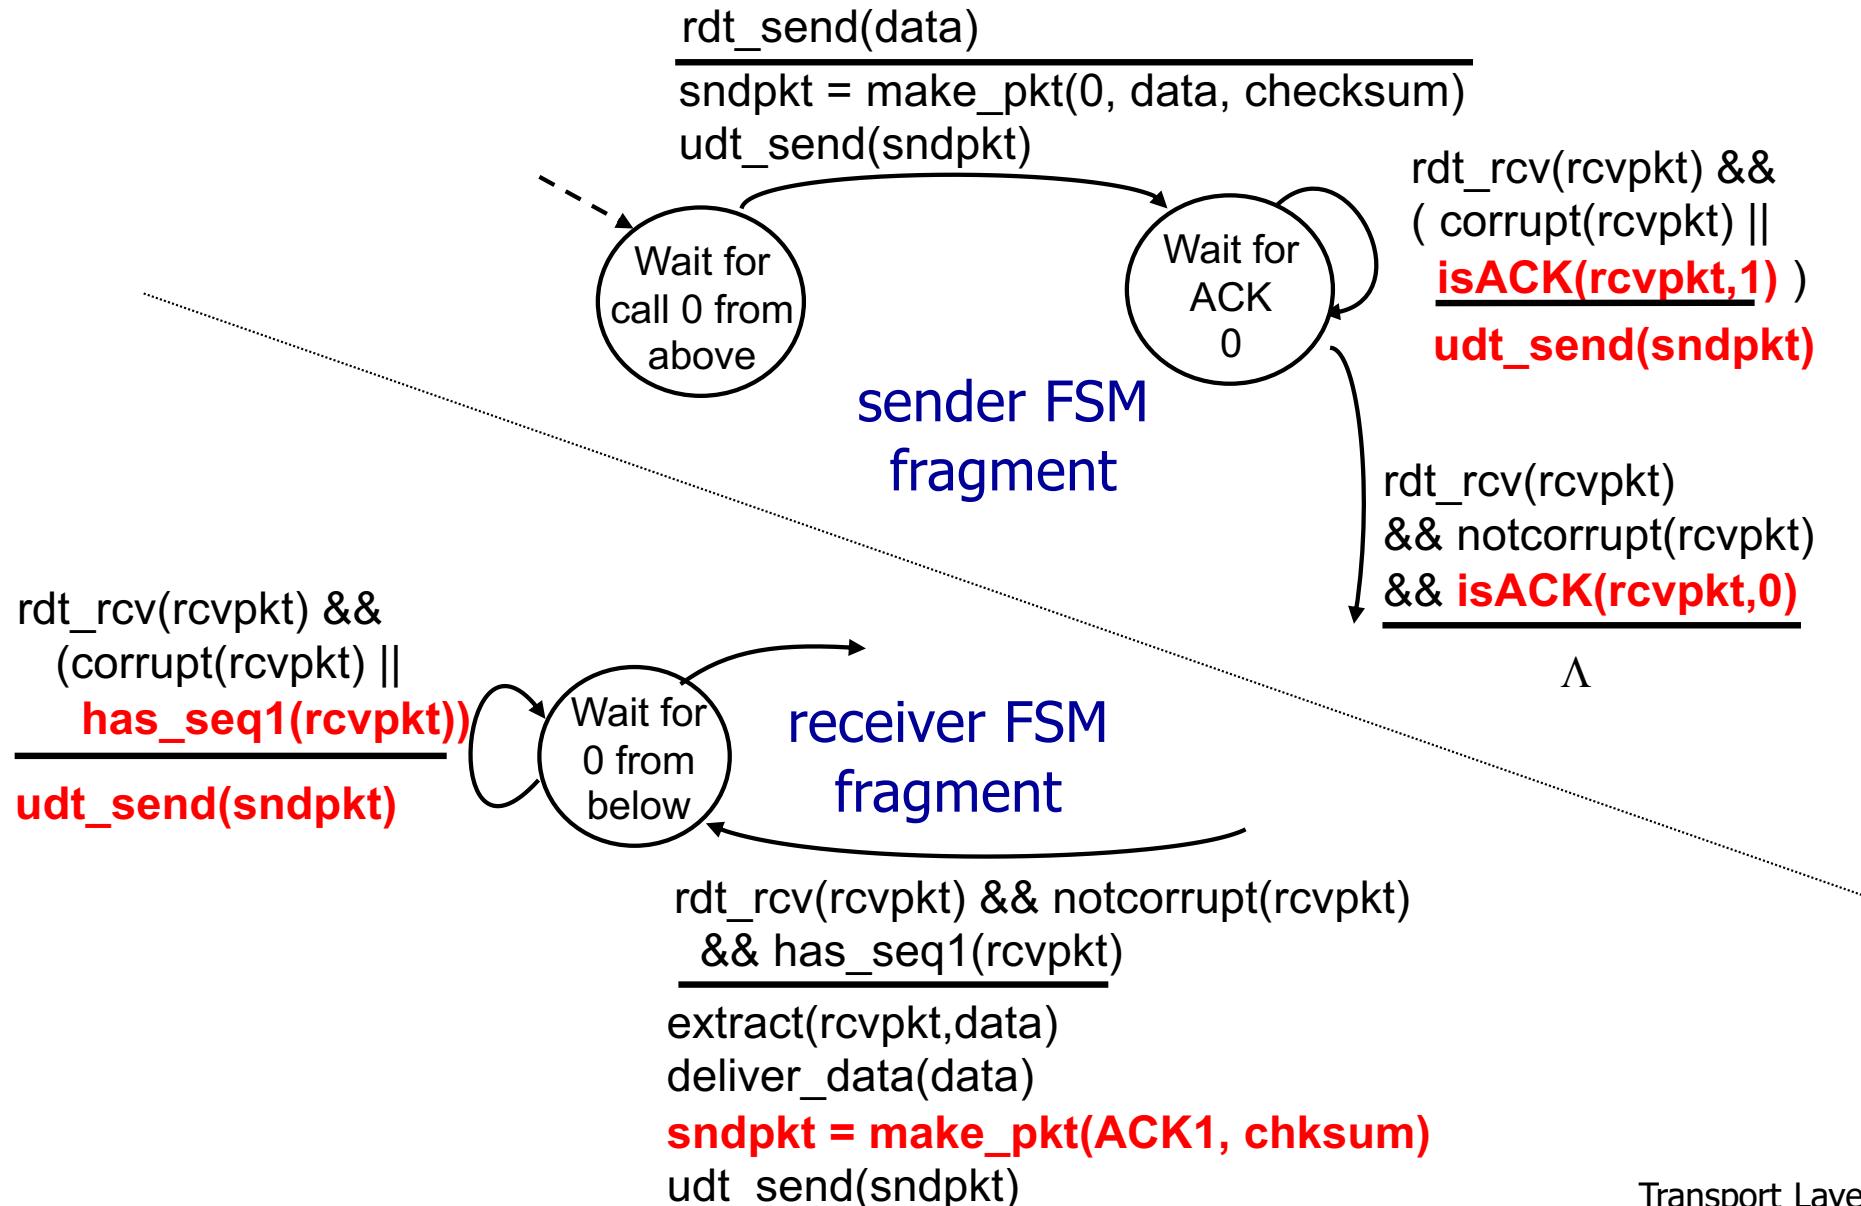

receiver:

- must check if received packet is duplicate
 - state indicates whether 0 or 1 is expected pkt seq #
- note: receiver can *not* know if its last ACK/NAK received OK at sender

rdt2.2: a NAK-free protocol

- same functionality as rdt2.1, using ACKs only
- instead of NAK, receiver sends ACK for last pkt received OK
 - receiver must *explicitly* include seq # of pkt being ACKed
- duplicate ACK at sender results in same action as NAK: *retransmit current pkt*

rdt2.2: sender, receiver fragments

rdt3.0: channels with errors and loss

new assumption:

underlying channel can also lose packets (data, ACKs)

- checksum, seq. #, ACKs, retransmissions will be of help ... but not enough

approach: sender waits

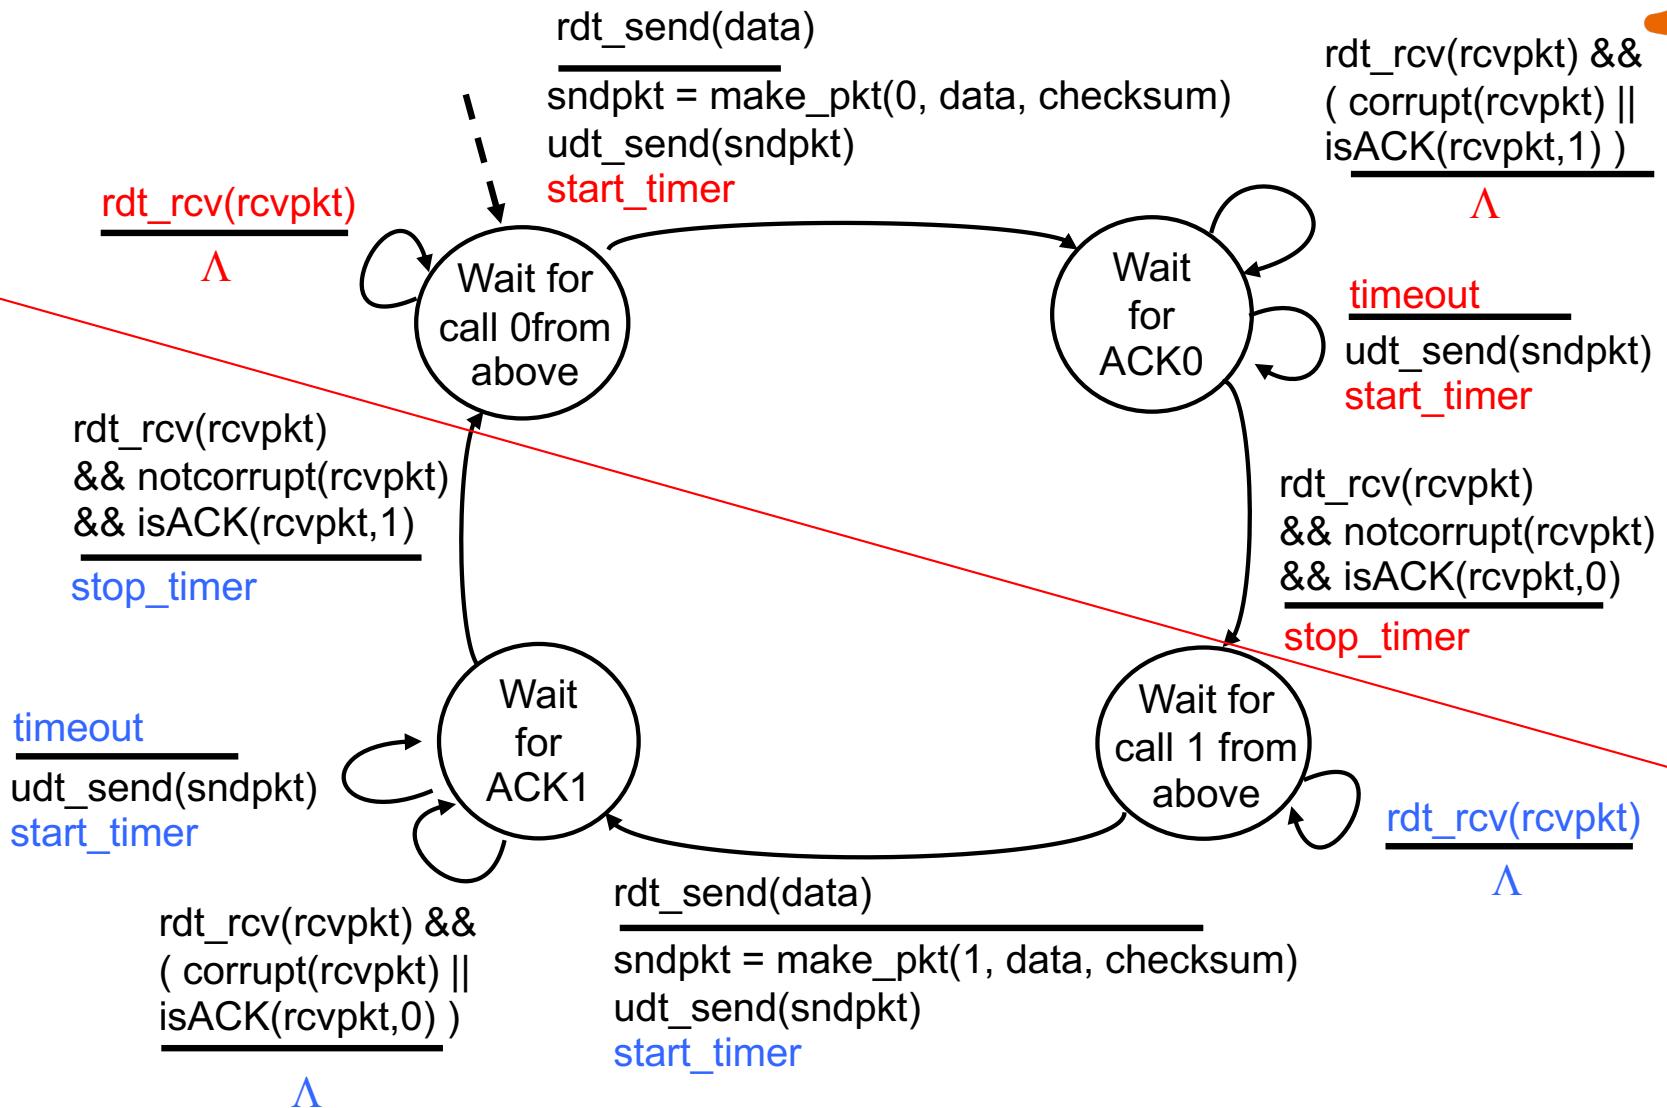

“reasonable” amount of time for ACK

- retransmits if no ACK received in this time
- if pkt (or ACK) just delayed (not lost):
 - retransmission will be duplicate, but seq. #'s already handles this
 - receiver must specify seq # of pkt being ACKed
- requires countdown timer

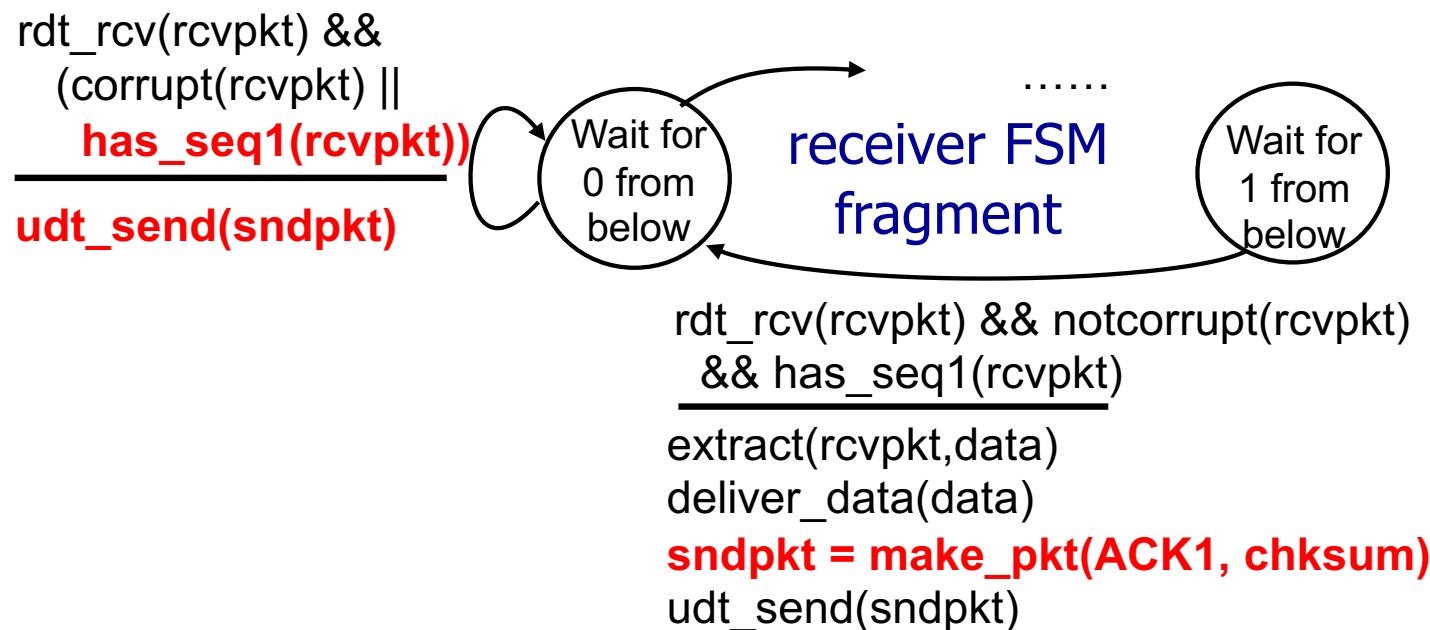

Long timer

- Slow to react to loss of acknowledgements
- Reduce overall throughput

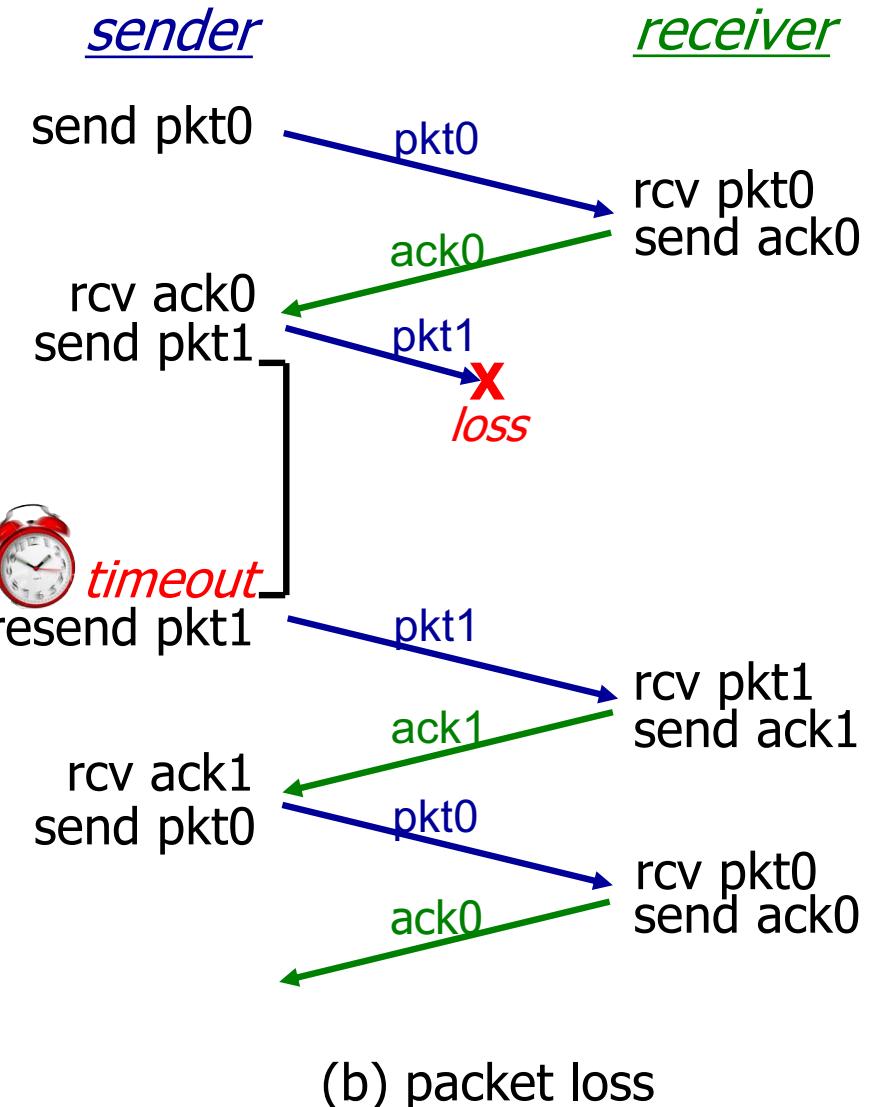

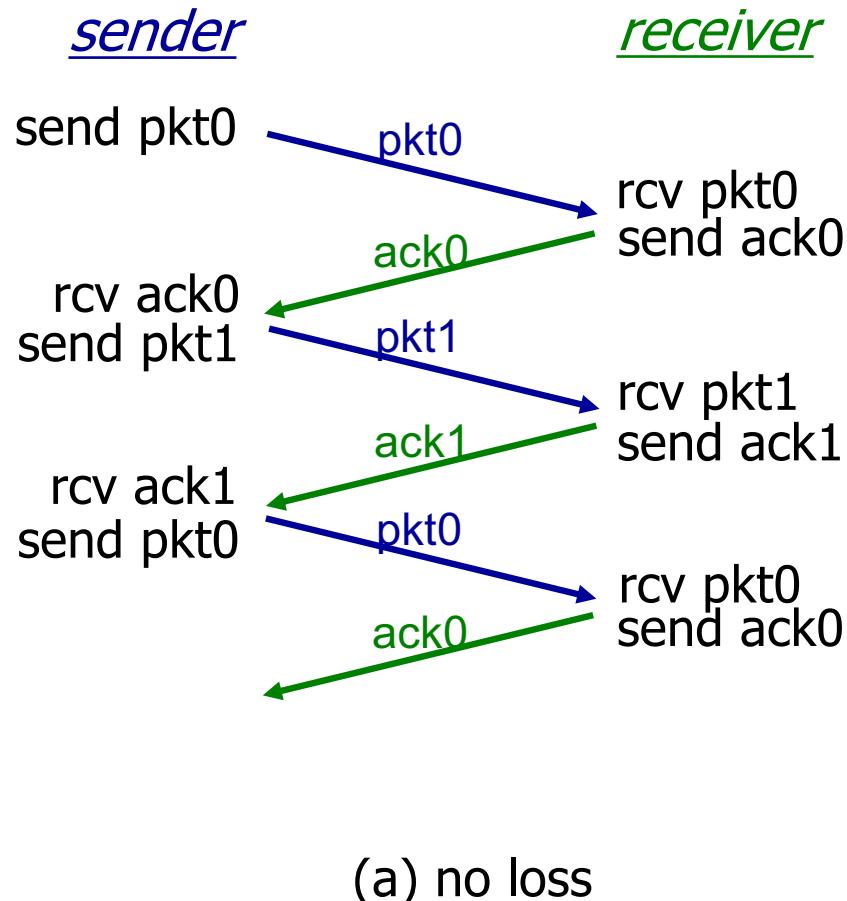

rdt3.0 sender

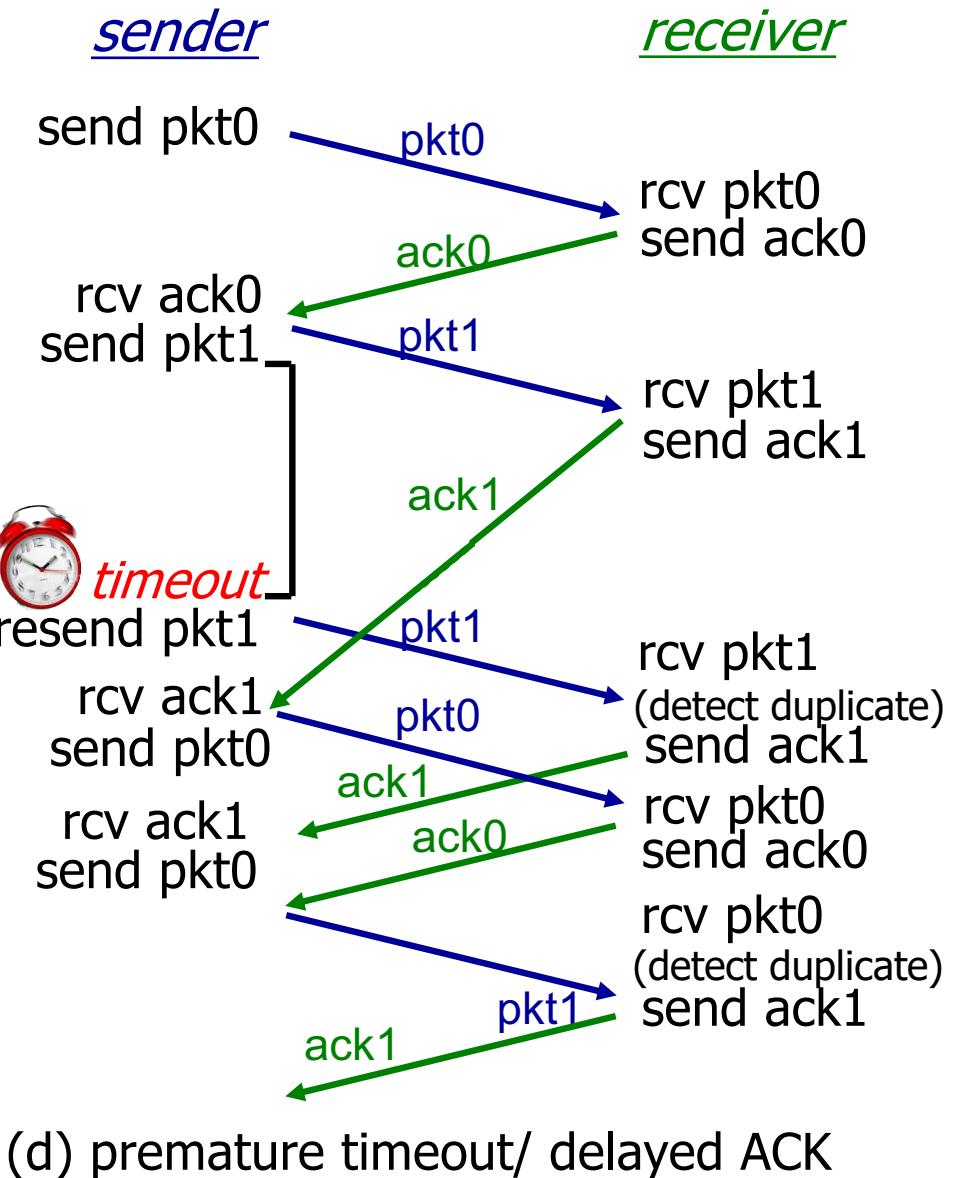

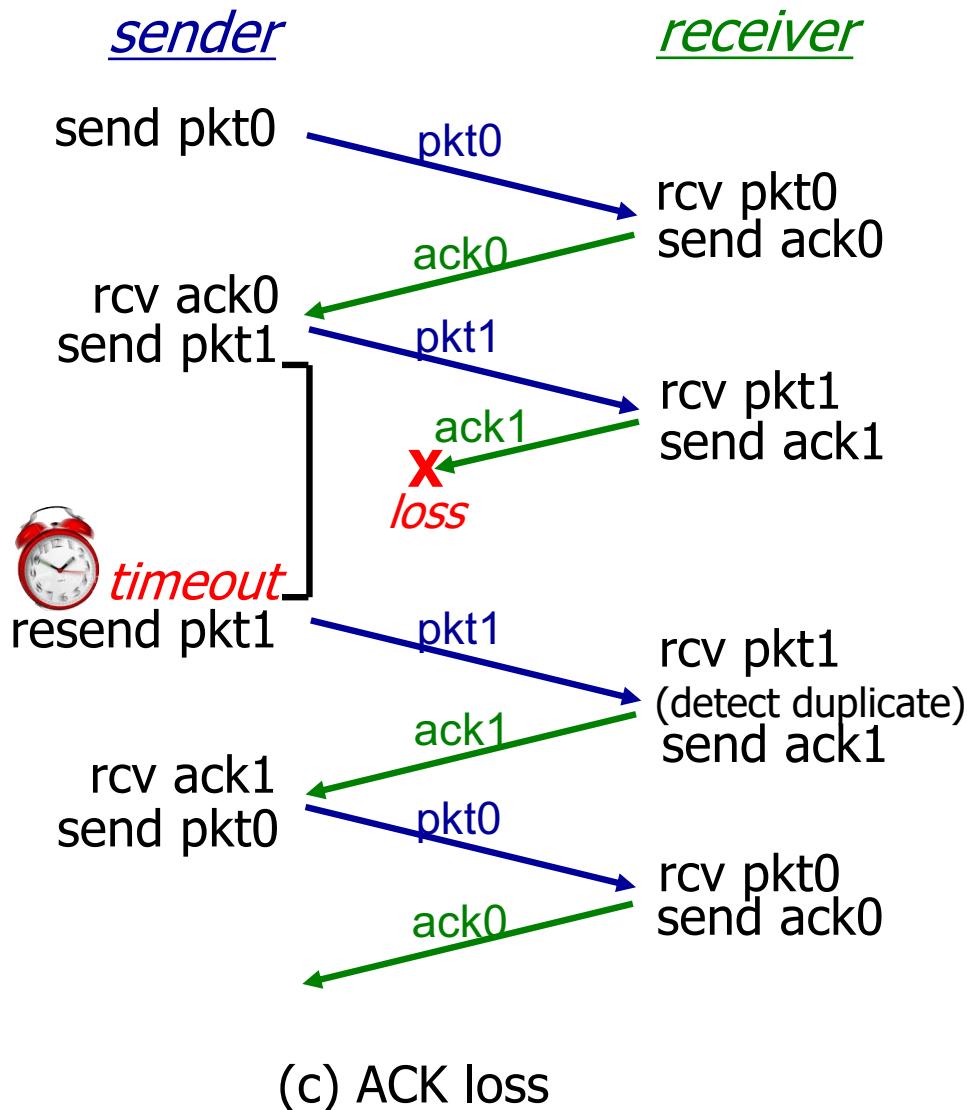

rdt3.0: receiver fragments

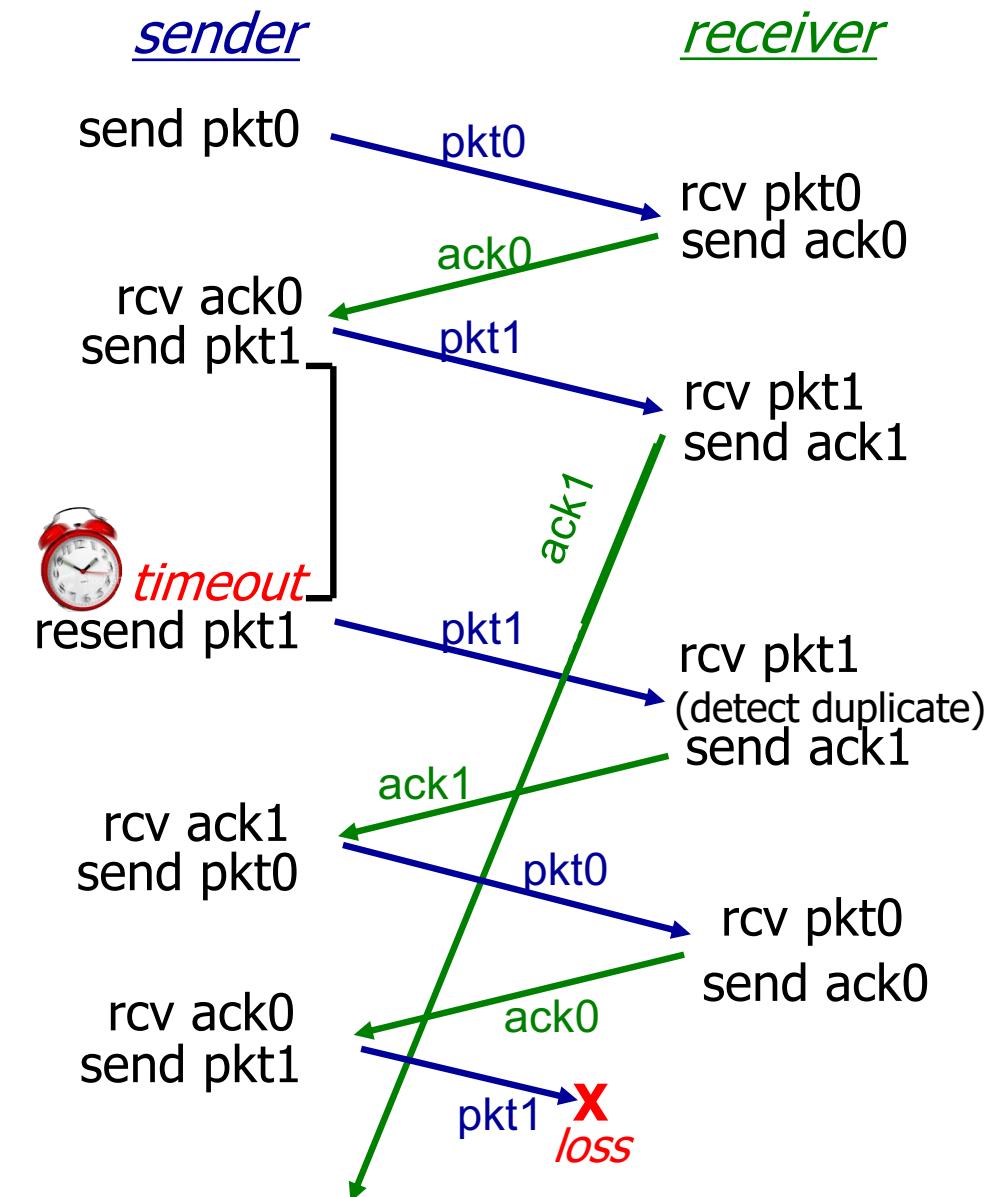

rdt3.0 in action

rdt3.0 in action

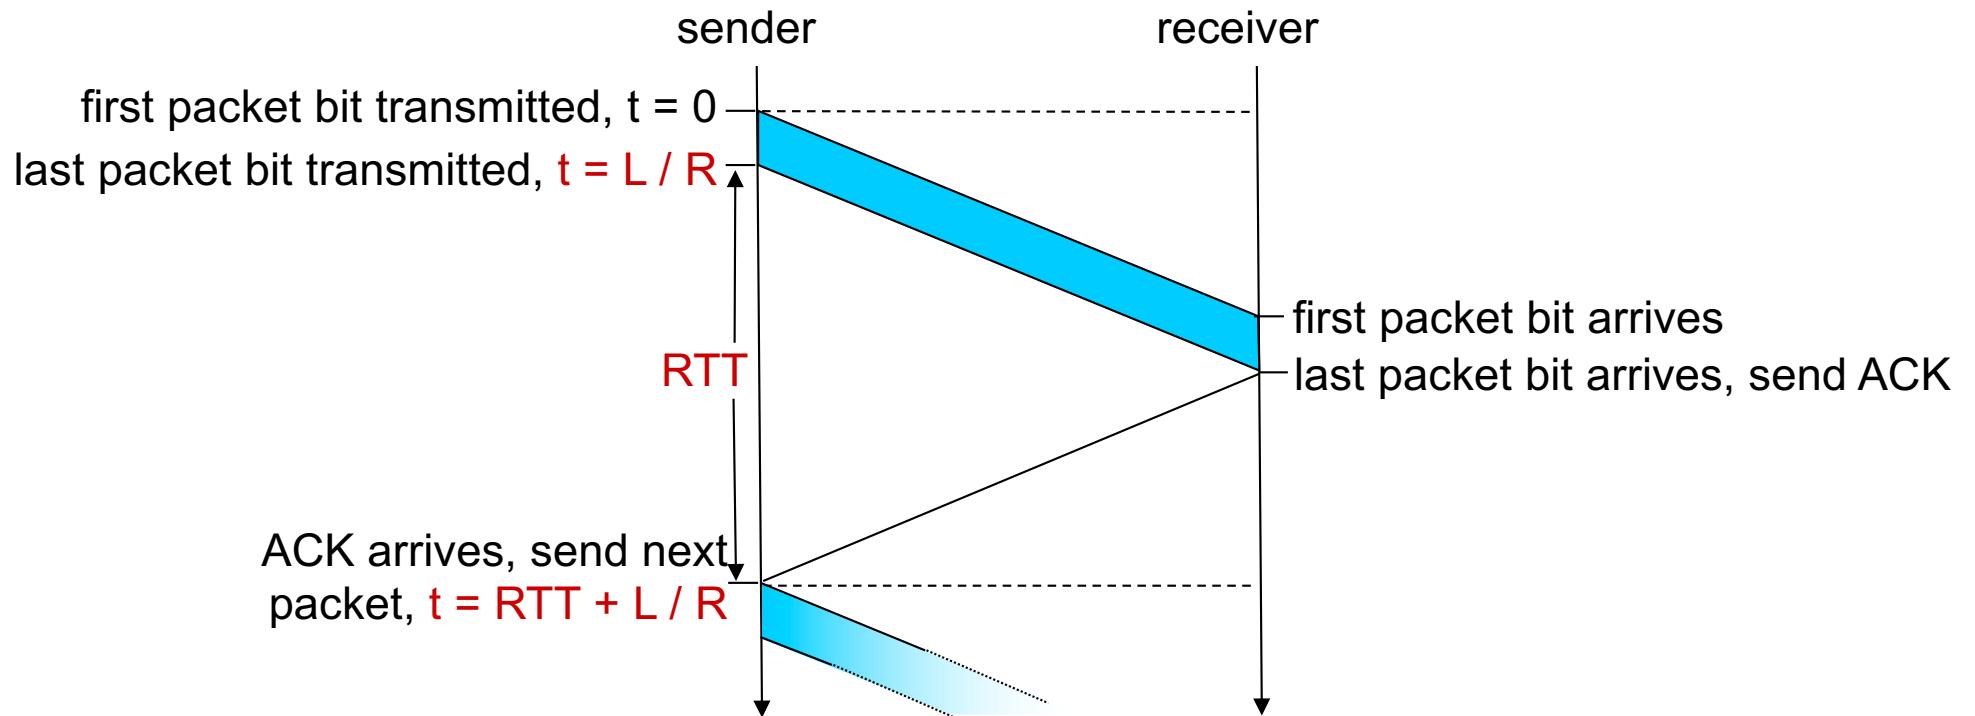

rdt3.0 in action

Theoretically need larger seq # space

rdt3.0: stop-and-wait operation

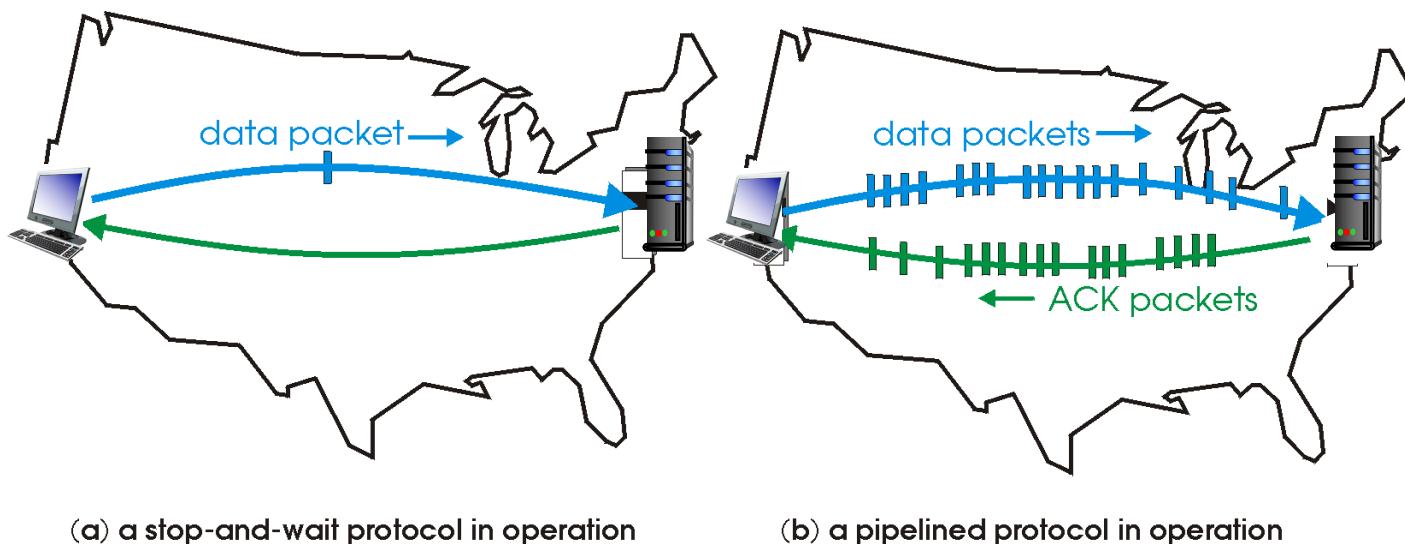

$$U_{\text{sender}} = \frac{L/R}{RTT + L/R} = \frac{.008}{30.008} = 0.00027$$

Pipelined protocols

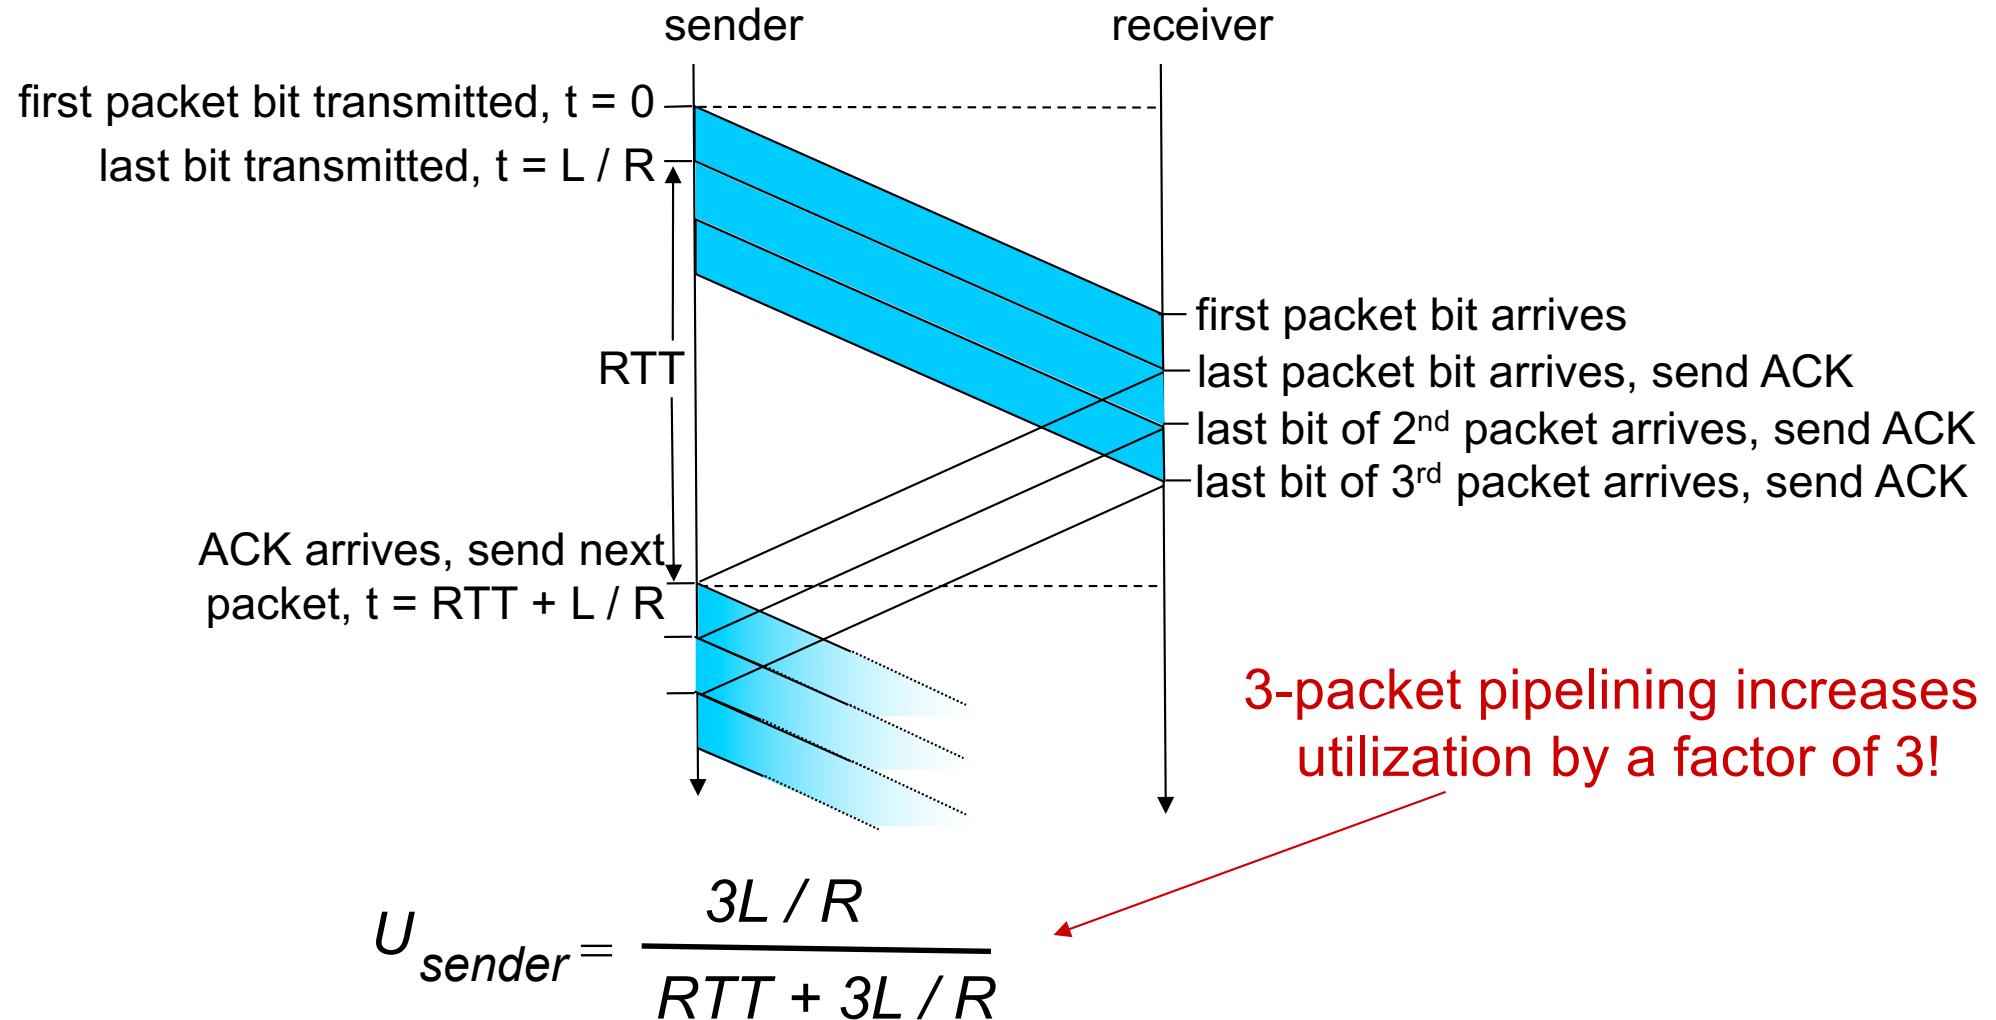

pipelining: sender allows multiple, “in-flight”, yet-to-be-acknowledged pkts

- range of sequence numbers must be increased
- buffering at sender and/or receiver

- two generic forms of pipelined protocols: *go-Back-N*, *selective repeat*

Pipelining: increased utilization

Pipelined protocols: overview

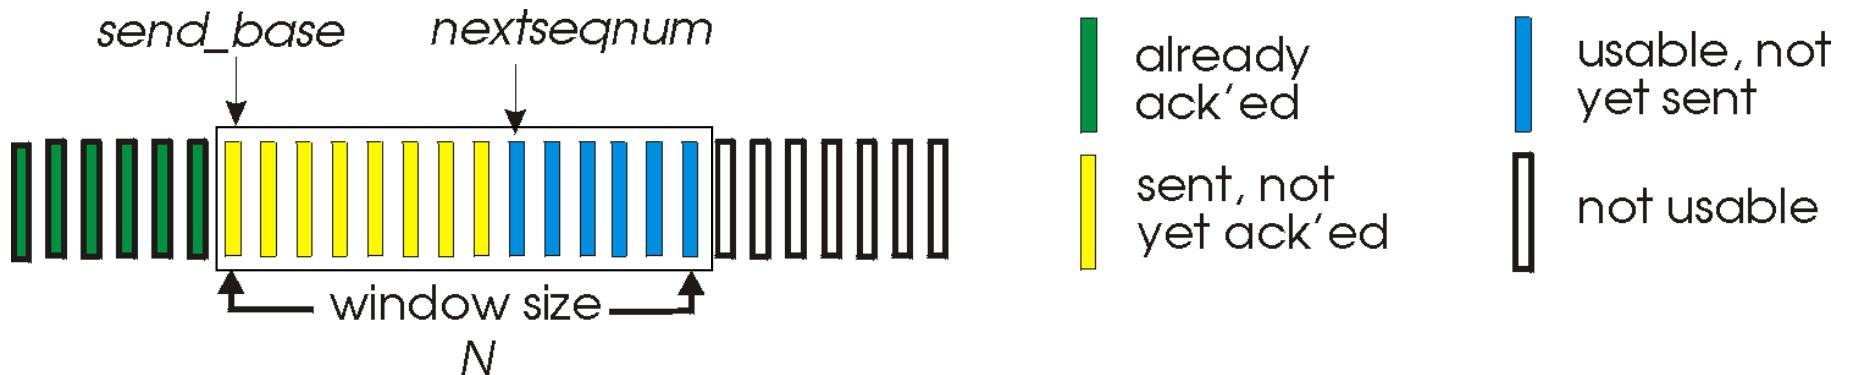

Go-back-N:

- sender can have up to N unacked packets in pipeline
- receiver only sends *cumulative ack*
 - doesn't ack packet if there's a gap
- sender has timer for oldest unacked packet
 - when timer expires, retransmit *all* unacked packets

Selective Repeat:

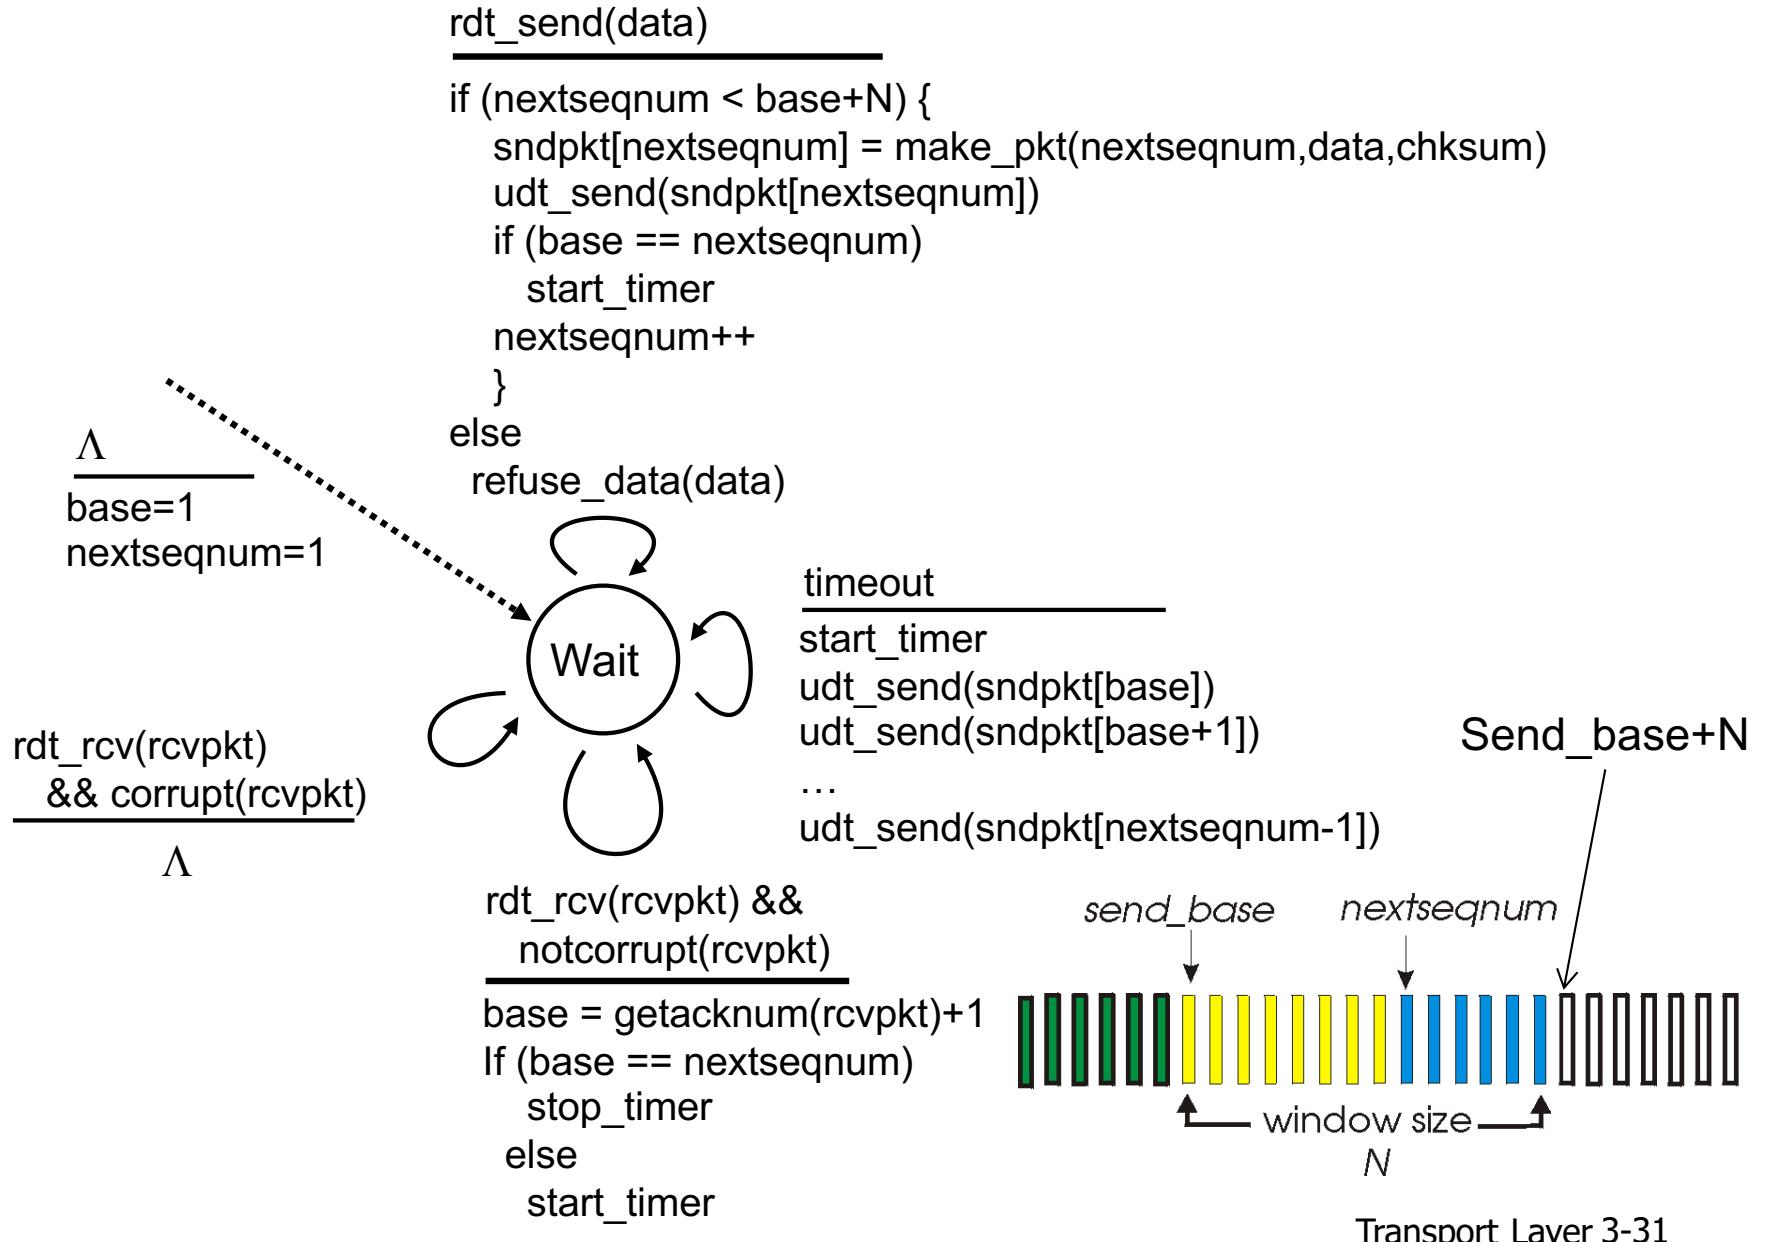

Go-Back-N: sender

- k-bit seq # in pkt header
- “window” of up to N, consecutive unack’ ed pkts allowed

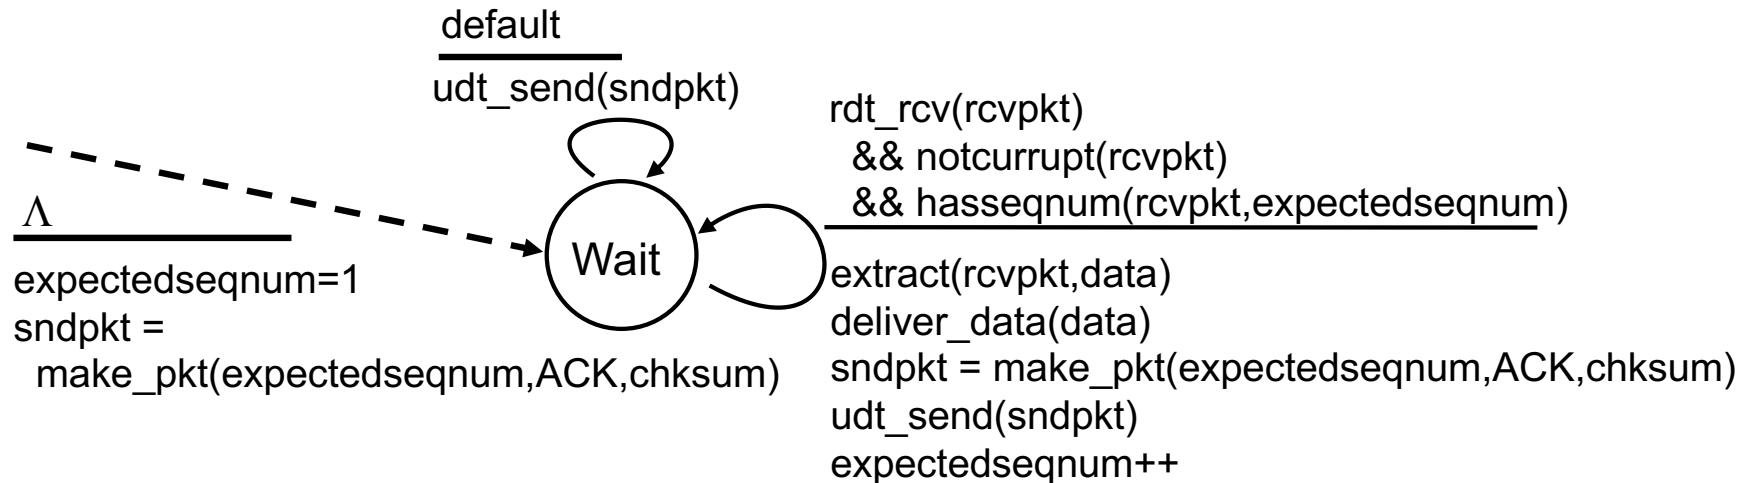

- ACK(n):ACKs all pkts up to, including seq # n - “*cumulative ACK*”
 - may receive duplicate ACKs (see receiver)
- timer for oldest in-flight pkt
- *timeout(n)*: retransmit packet n and all higher seq # pkts in window

GBN: sender extended FSM

GBN: receiver extended FSM

ACK-only: always send ACK for correctly-received
pkt with highest *in-order* seq #

- may generate duplicate ACKs
 - need only remember **expectedseqnum**
- out-of-order pkt:
- discard (don't buffer): *no receiver buffering!*
 - re-ACK pkt with highest in-order seq #

GBN in action

sender window (N=4)

0	1	2	3	4	5	6	7	8
0	1	2	3	4	5	6	7	8
0	1	2	3	4	5	6	7	8
0	1	2	3	4	5	6	7	8

0	1	2	3	4	5	6	7	8
0	1	2	3	4	5	6	7	8

0	1	2	3	4	5	6	7	8
0	1	2	3	4	5	6	7	8
0	1	2	3	4	5	6	7	8
0	1	2	3	4	5	6	7	8

sender

send pkt0
send pkt1
send pkt2
send pkt3
(wait)

rcv ack0, send pkt4
rcv ack1, send pkt5

ignore duplicate ACK

pkt 2 timeout

send pkt2
send pkt3
send pkt4
send pkt5

receiver

receive pkt0, send ack0
receive pkt1, send ack1

receive pkt3, discard,
(re)send ack1

receive pkt4, discard,
(re)send ack1

receive pkt5, discard,
(re)send ack1

rcv pkt2, deliver, send ack2
rcv pkt3, deliver, send ack3
rcv pkt4, deliver, send ack4
rcv pkt5, deliver, send ack5
